Chapter 1
The World of Mechanisms

1.1 Sketch at least six different examples of the use of a planar four-bar linkage in practice. These can be found in the workshop, in domestic appliances, on vehicles, on agricultural machines, and so on.

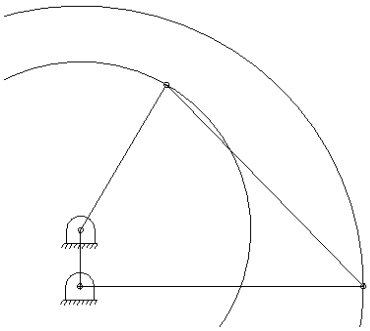

Since the variety is unbounded no standard solutions are provided here.

1.2 The link lengths of a planar four-bar linkage are 1 in, 3 in, 5 in, and 5 in. Assemble the links in all possible combinations and sketch the four inversions of each. Do these linkages satisfy Grashof's law? Describe each inversion by name, for example, a crank-rocker linkage or a drag-link linkage.

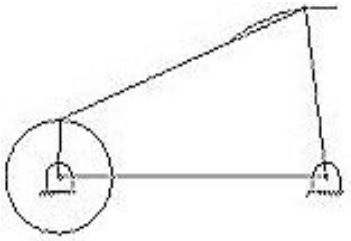

$s = 1$ in, $l = 5$ in, $p = 3$ in, $q = 5$ in; these linkages all satisfy Grashof's law since $1 \text{ in} + 5 \text{ in} < 3 \text{ in} + 5 \text{ in}$. *Ans.*

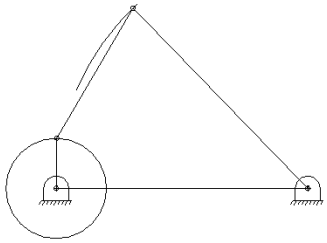

Drag-link linkage

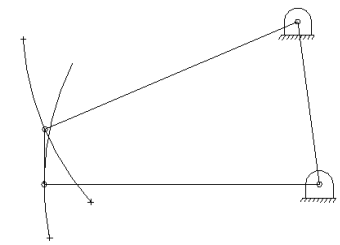

Drag-link linkage *Ans.*

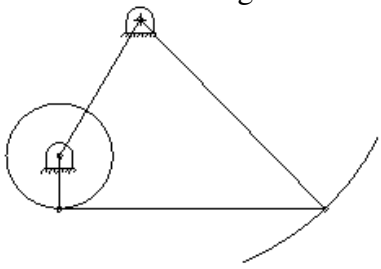

Crank-rocker linkage

Crank-rocker linkage *Ans.*

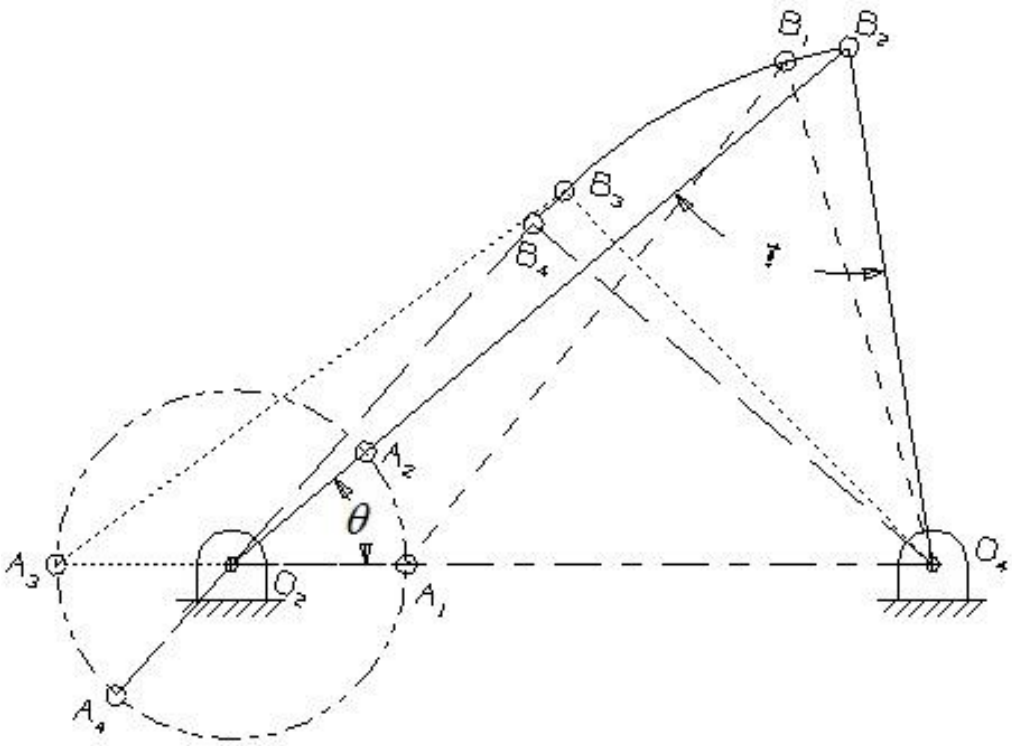

Double-rocker linkage

Crank-rocker linkage *Ans.*

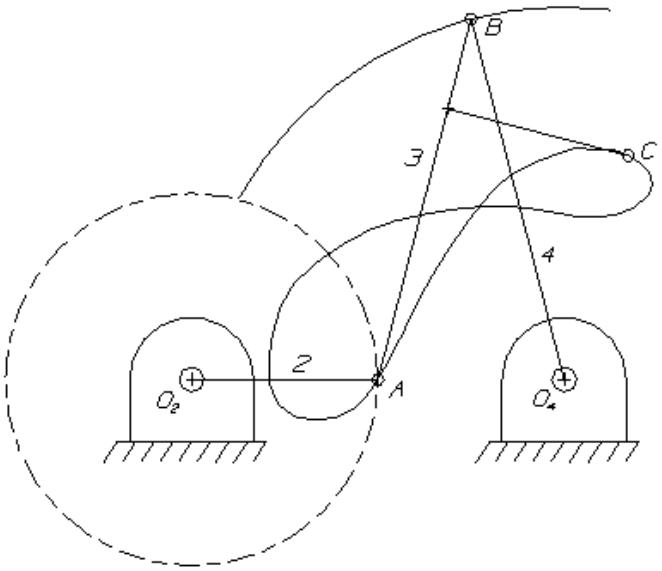

1.3 A crank-rocker linkage has a 100-mm frame, a 25-mm crank, a 90-mm coupler, and a 75-mm rocker. Draw the linkage and find the maximum and minimum values of the transmission angle. Locate both toggle postures and record the corresponding crank angles and transmission angles.

Extremum transmission angles: $\gamma_{\min} = \gamma_1 = 53.1°;\ \gamma_{\max} = \gamma_3 = 98.1°$ *Ans.*

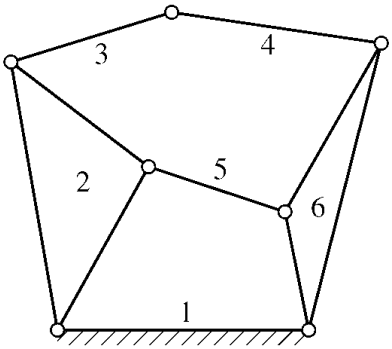

Toggle postures: $\theta_2 = 40.1°; \gamma_2 = 59.1°;\ \theta_4 = 228.6°; \gamma_4 = 90.9°$ *Ans.*

1.4 Plot the complete path of coupler point *C*.

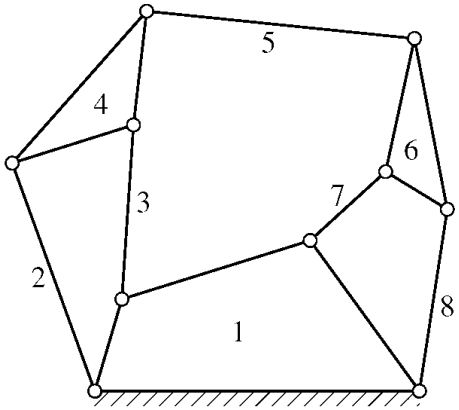

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

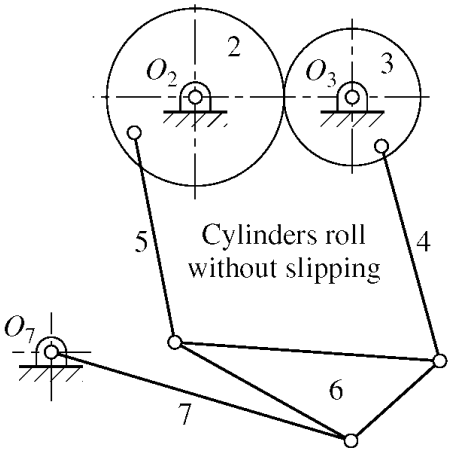

1.5 Find the mobility of each mechanism.

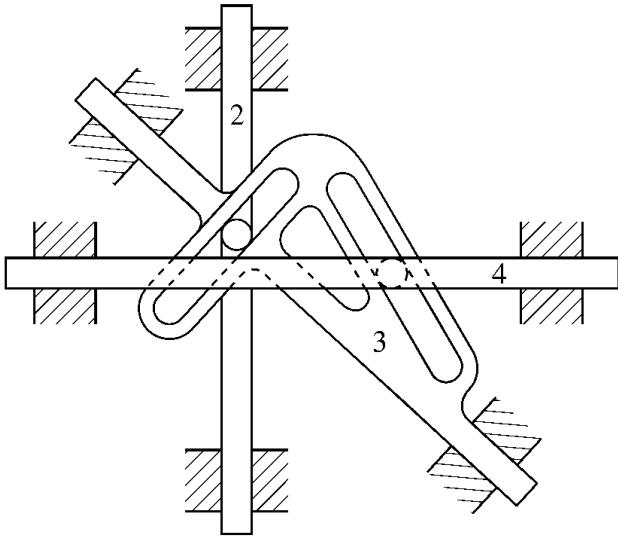

(*a*)

(*b*)

(*c*)

(*d*)

(*a*) $n=6,\ j_1=7,\ j_2=0;$ $m=3(6-1)-2(7)-1(0)=1$ *Ans.*

(*b*) $n=8,\ j_1=10,\ j_2=0;$ $m=3(8-1)-2(10)-1(0)=1$ *Ans.*

(*c*) $n=7,\ j_1=9,\ j_2=0;$ $m=3(7-1)-2(9)-1(0)=0$ *Ans.*

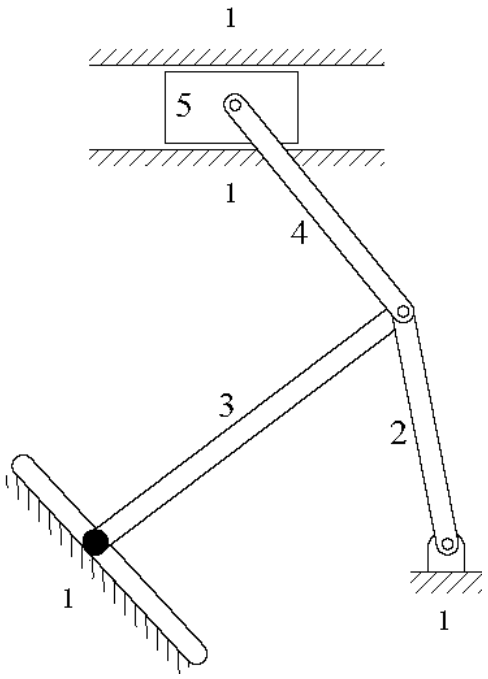

Note that the Kutzbach criterion fails in the case of part (*c*); the true mobility is m=1. The exception is due to a redundant constraint. The assumption that the rolling contact joint does not allow links 2 and 3 to separate duplicates the constraint of the fixed link length O_2O_3.

(*d*) $n=4,\ j_1=3,\ j_2=2;$ $m=3(4-1)-2(3)-1(2)=1$ *Ans.*

Note in part (*d*) that each pair of coaxial sliding ground joints is counted as only a single prismatic pair.

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

1.6 Use the Kutzbach criterion to determine the mobility of the mechanism.

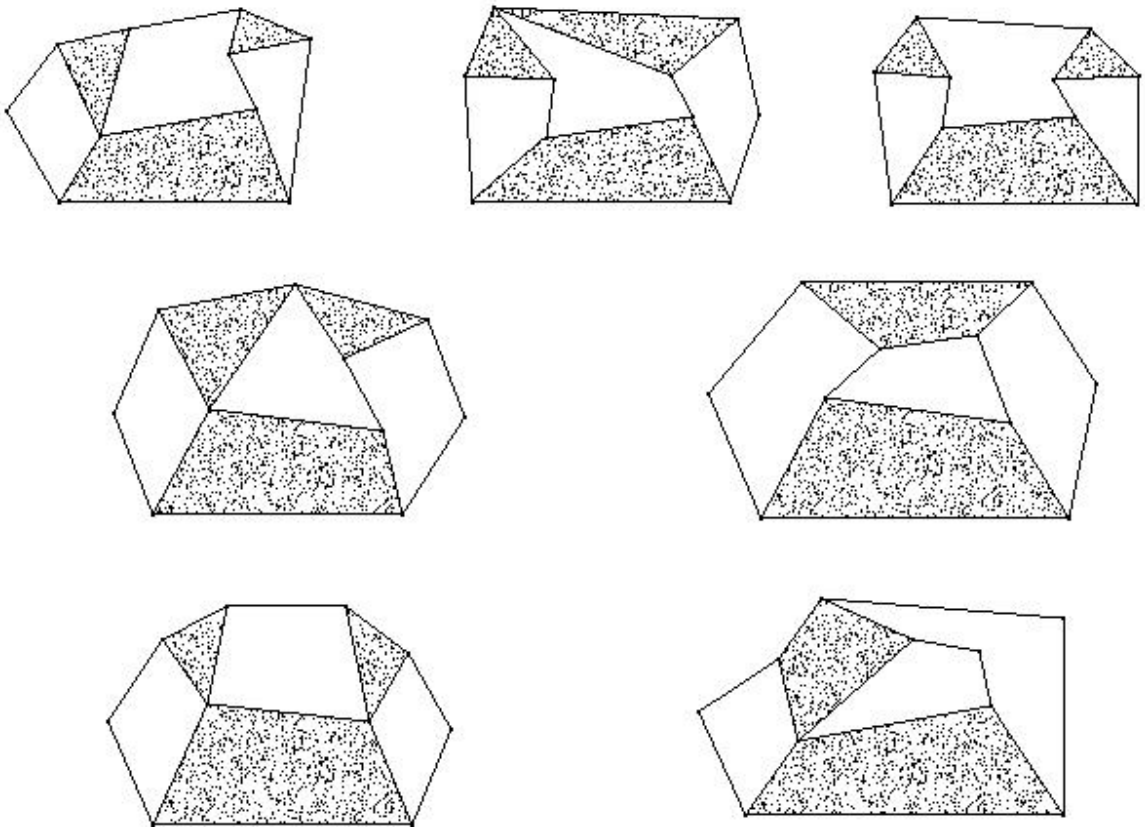

$n = 5,\ j_1 = 5,\ j_2 = 1;$ $\qquad m = 3(5-1) - 2(5) - 1(1) = 1$ *Ans.*

Note that the double pin is counted as two single pin j_1 joints.

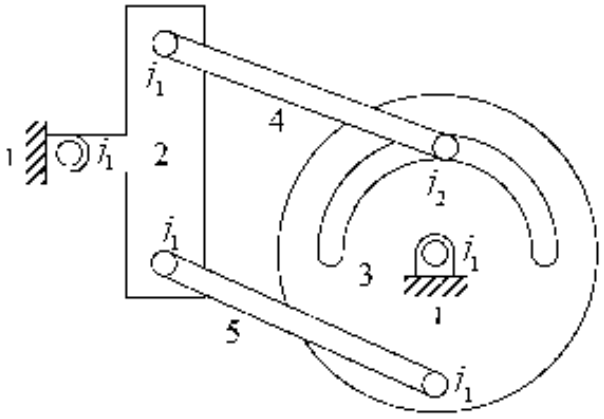

1.7 Sketch a planar linkage with only revolute joints and a mobility of m=1 that contains a moving quaternary link. How many distinct variations of this linkage can you find?

To have at least one quaternary link, a planar linkage must have at least eight links. The Kutzbach criterion then indicates that ten single-freedom joints are required for mobility of m = 1. According to H. Alt, 1955. "Die Analyse und Synthese der achtgleidrigen Gelenkgetriebe", *VDI-Berichte*, **5**, pp. 81-93, there are a total of sixteen distinct eight-link planar linkages having ten revolute joints, seven of which contain a quaternary link. These seven are illustrated here: *Ans.*

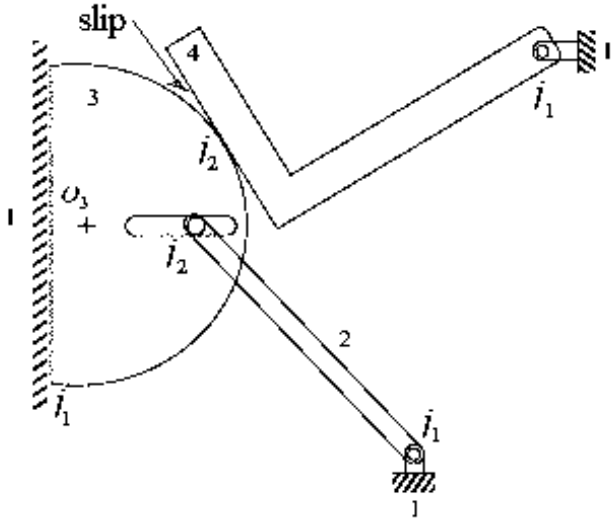

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

1.8 Use the Kutzbach criterion to detemine the mobility of the mechanism. Clearly number each link and label the lower pairs (j_1 joints) and higher pairs (j_2 joints).

$n=5,\ j_1=5,\ j_2=1;$ $\quad m=3(5-1)-2(5)-1(1)=1$ *Ans.*

1.9 Determine the number of links, the number of lower pairs, and the number of higher pairs. Use the Kutzbach criterion to determine the mobility of the mechanism. Is the answer correct? Briefly explain.

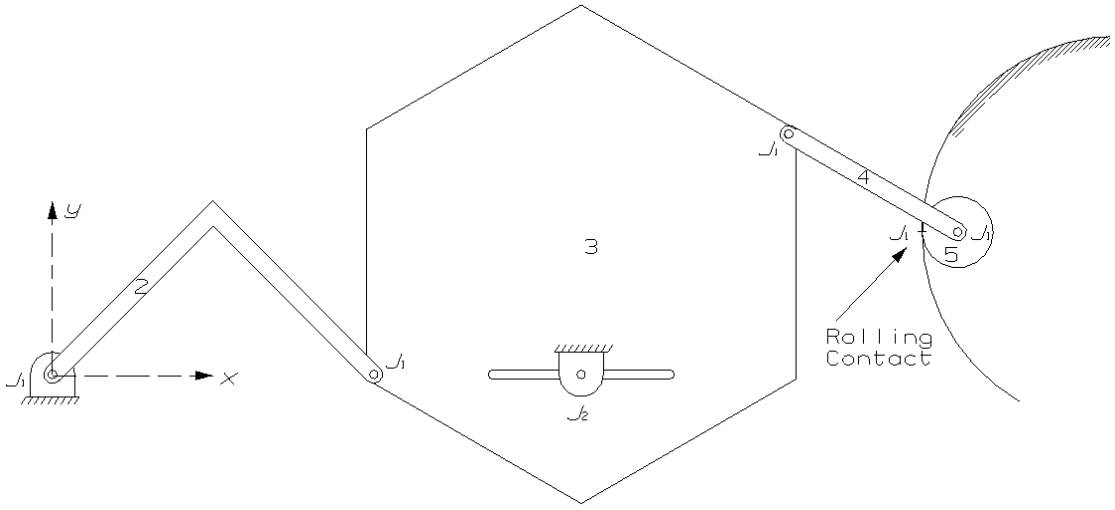

$n=4,\ j_1=3,\ j_2=2;$ $\quad m=3(4-1)-2(3)-1(2)=1$ *Ans.*

If it is not evident visually that link 3 can be incremented upward without jamming, then consider incrementing link 3 downward. Since it is clear visually that this determines the position of all other links, this verifies that mobility of one is correct.

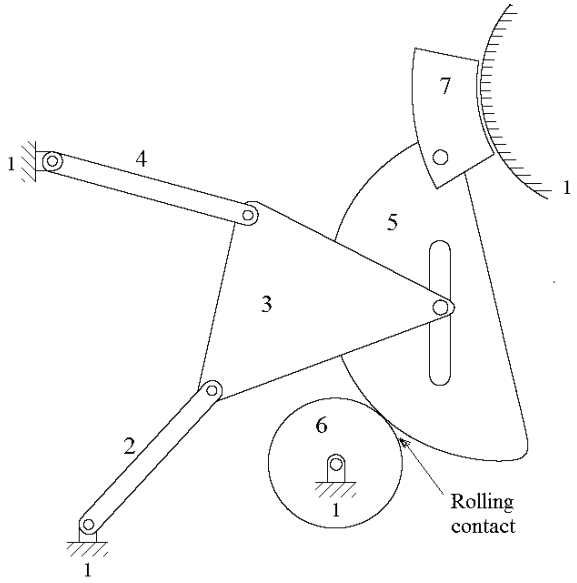

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

1.10 Use the Kutzbach criterion to detemine the mobility of the mechanism. Clearly number each link and label the lower pairs and higher pairs.

$n = 5,\ j_1 = 5,\ j_2 = 1;$ $\qquad m = 3(5-1) - 2(5) - 1(1) = 1$ *Ans.*

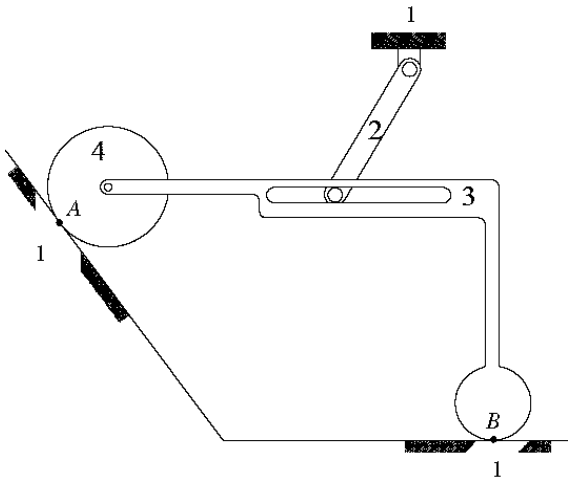

1.11 Determine the number of links, the number of lower pairs, and the number of higher pairs. Treat rolling contact to mean rolling with no slipping. Using the Kutzbach criterion determine the mobility. Is the answer correct? Briefly explain.

$n = 7,\ j_1 = 8,\ j_2 = 1;$ $\qquad m = 3(7-1) - 2(8) - 1(1) = 1$ *Ans.*

This result appears to be correct. If all parts remain assembled (connected), then within the limits of travel of the joints illustrated, it appears that when any one joint is locked the total system becomes a structure.

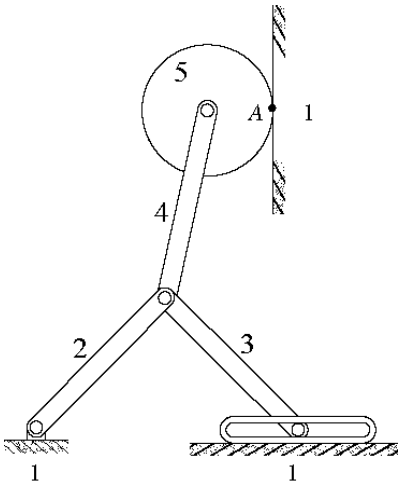

1.12 Does the Kutzbach criterion provide the correct result for this mechanism? Briefly explain why or why not.

$n = 4,\ j_1 = 2,\ j_2 = 3;$ $\qquad m = 3(4-1) - 2(2) - 1(3) = 2$ *Ans.*

The joints at *A* and *B* are both assumed to allow slipping and are j_2 joints. This results in $m = 2$ which appears to be correct. If any part except wheel 4 is moved, all other parts are required to follow. However, after all other parts are in a certain posture, wheel 4 is still able to rotate while slipping against the frame at *A*.

1.13 The mobility of the mechanism is $m = 1$. Use the Kutzbach criterion to determine the number of lower pairs and the number of higher pairs. Is the wheel rolling without slipping, or rolling and slipping, at point *A* on the wall?

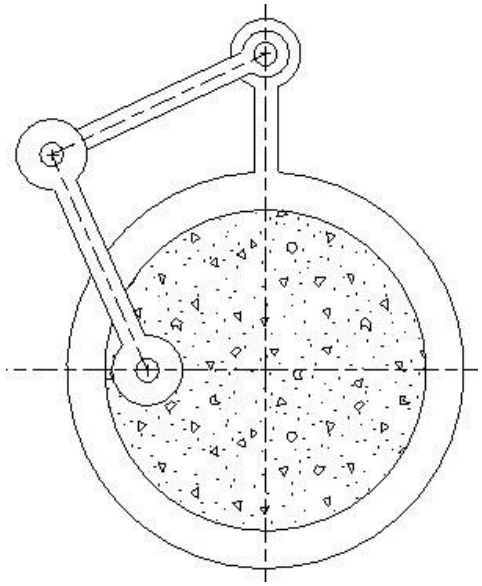

Suppose that we identify the number of independent freedoms at *A* by the symbol *k*. Then if we account for all links and all other joints as follows, the Kutzbach criterion gives

$n = 5;\ j_1 = 4;\ j_2 = 1;\ j_k = 1;$ $\qquad m = 3(5-1) - 2(4) - 1(1) - (3-k)(1) = k;$

Therefore, to have mobility of $m = 1$, we must have $k = 1$ independent freedom at *A*. The wheel must be rolling without slipping. Then, $n = 5;\ j_1 = 5;\ j_2 = 1;$ and $m = 1;$ *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

1.14 Devise a practical working model of the drag-link linkage

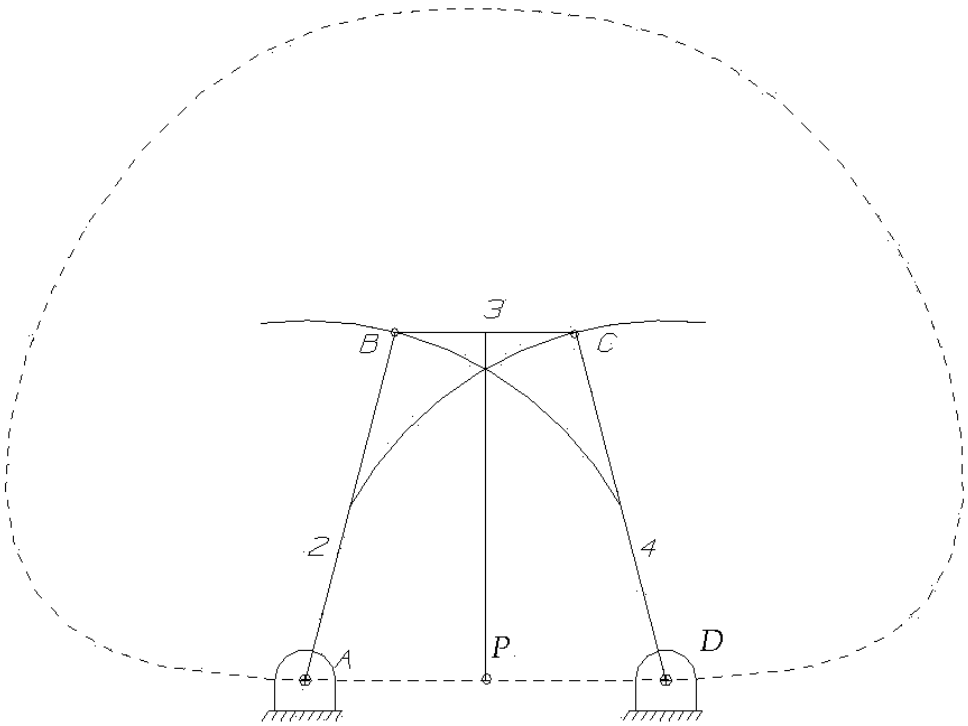

Ans.

1.15 Find the advance-to-return ratio of the linkage of Prob. 1.3.

From the values of θ_2 and θ_4 we find $\alpha = 188.5°$ and $\beta = 171.5°$.

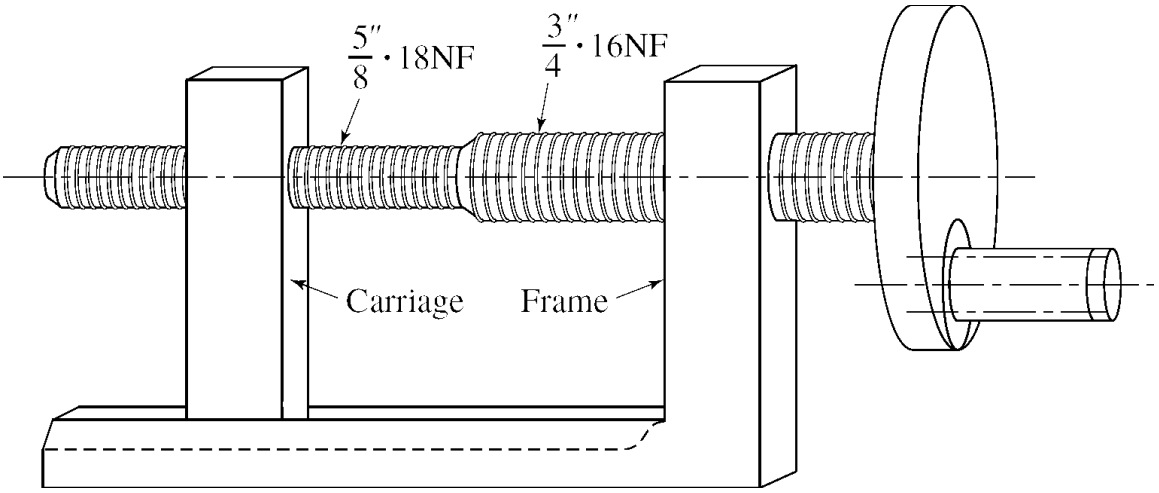

Then, from Eq. (1.5), $Q = \alpha/\beta = 1.099$. *Ans.*

1.16 Plot the complete coupler curve of Roberts' linkage illustrated in Fig. 1.24*b*. Use $AB = CD = AD = 2.5$ in and $BC = 1.25$ in.

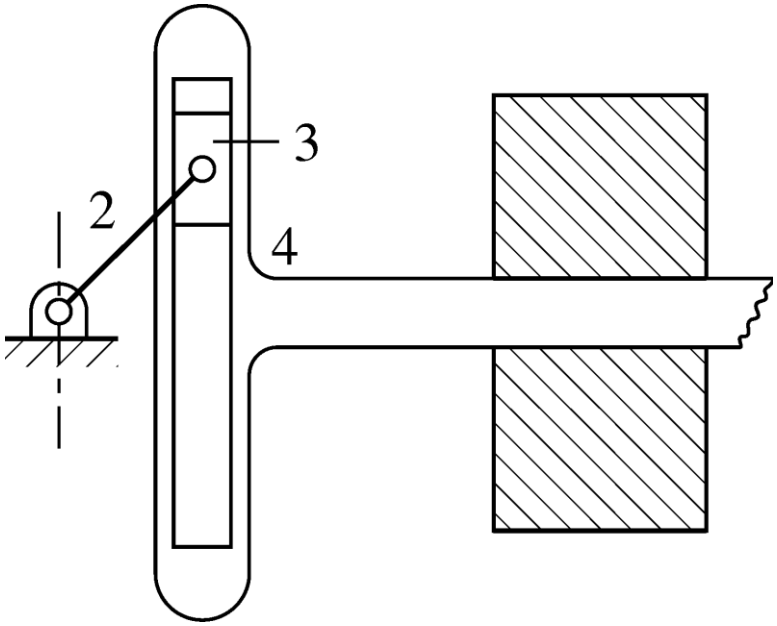

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

1.17 If the handle of the differential screw in Fig. 1.11 is turned 15 revolutions clockwise, how far and in what direction does the carriage move?

Screw and carriage move by (15 rev)/(16 rev/in) = 0.937 50 in to the left.
Carriage moves (15 rev)/(18 rev/in) = 0.833 33 in to the right with respect to the screw.
Net motion of carriage = 15/16 in – 15/18 in = 15/144 = 0.104 17 in to the left. *Ans.*

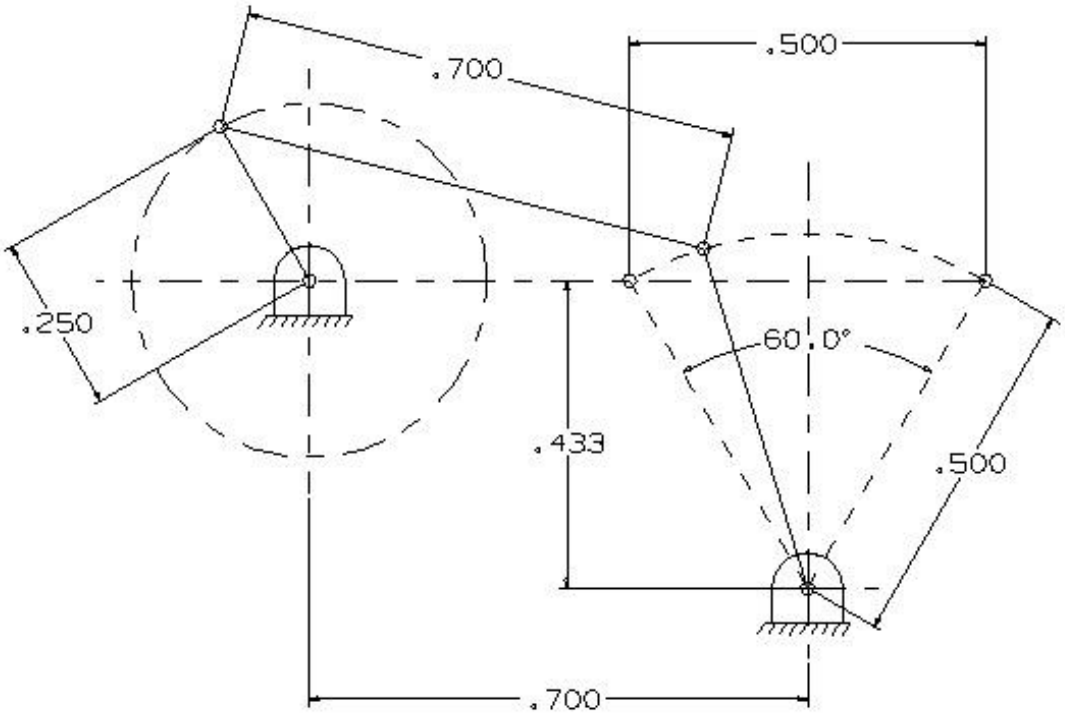

1.18 Show how the linkage of Fig. 1.15*b* can be used to generate a sine wave.

With the length and angle of crank 2 designated as R and θ_2, respectively, the horizontal motion of link 4 is $x_4 = R\cos\theta_2 = R\sin(\theta_2 + 90°)$.

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

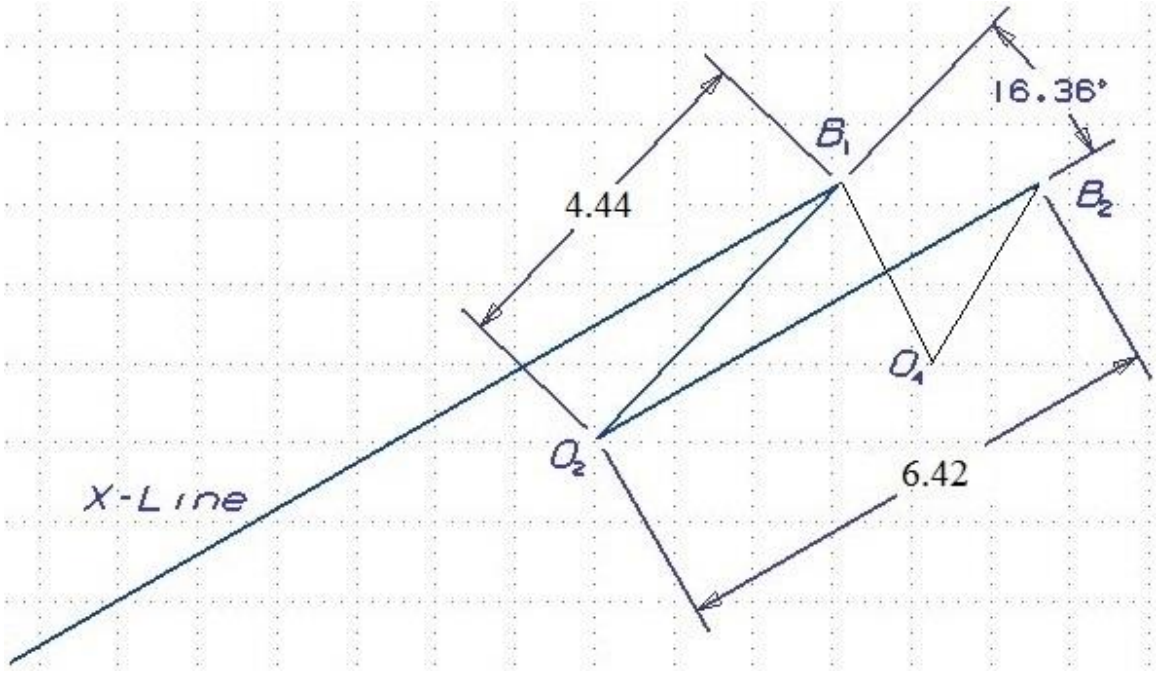

1.19 Devise a crank-rocker four-bar linkage, as in Fig. 1.14*c*, having a rocker angle of 60°. The rocker length is to be 0.50 m.

Distances shown are in meters. *Ans.*

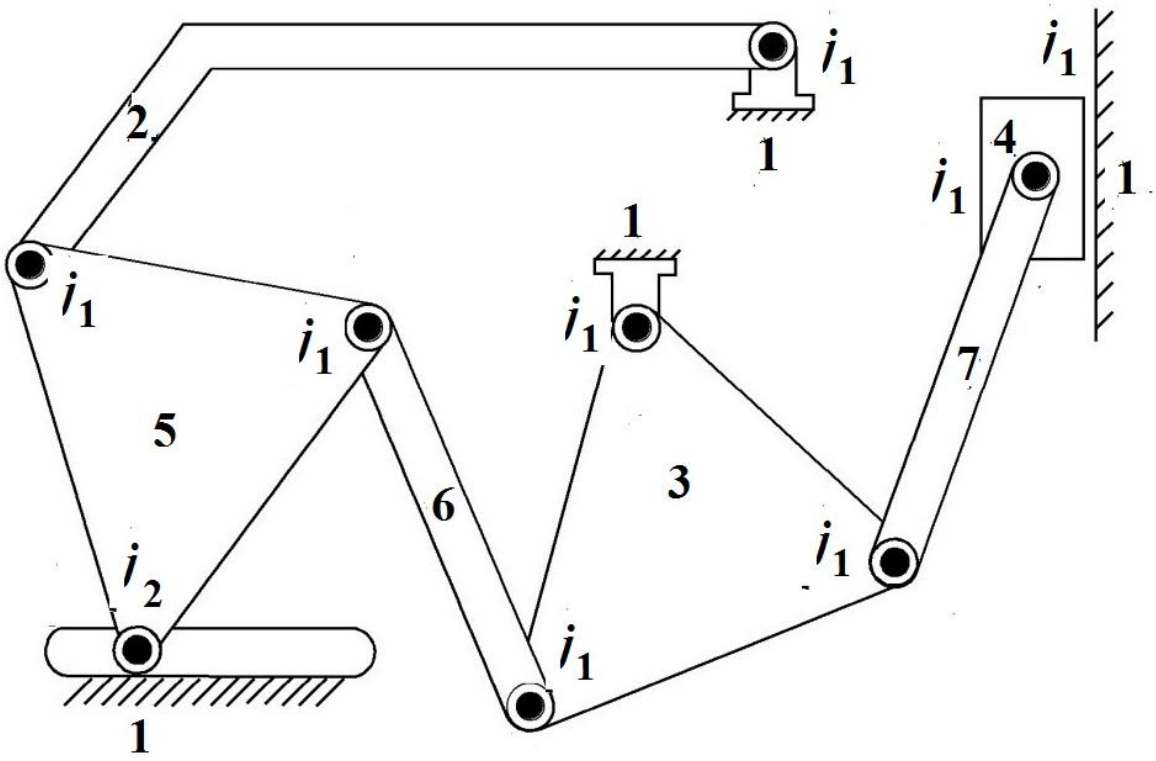

1.20 A crank-rocker four-bar linkage is required to have an advance-to-return ratio Q = 1.2. The rocker is to have a length of 2.5 in and oscillate through a total angle of 60°. Determine a suitable set of link lengths for the remaining three links of the four-bar linkage.

Following the procedure of Example 1.4, the required advance-to-return ratio gives $Q=(180°+\phi)/(180°-\phi)=1.2$ and, therefore, we must have $\phi=16.36°$. Then, with the X-line chosen at 30°, the drawing shown below gives measured distances of $R_{O_4O_2}=r_1=4.34$ in, $R_{B_2O_2}=r_3+r_2=6.42$ in, and $R_{B_1O_2}=r_3-r_2=4.44$ in. From these we get one possible solution, which has link lengths of $R_{O_4O_2}=r_1=4.34$ in, $R_{AO_2}=r_2=0.99$ in, $R_{BA}=r_3=5.43$ in, and $R_{BO_4}=r_4=2.50$ in. *Ans.*

Distances shown are in inches

1.21 Determine the mobility of the mechanism. Number each link and label the lower pairs and the higher pairs. Identify a suitable input, or inputs, for the mechanism.

The link numbers and joint types of the mechanism. *Ans.*

The number of links, lower pairs, and higher pairs, respectively, are

$$n = 7,\ j_1 = 8, \text{ and } j_2 = 1.$$

Substituting these values into the Kutzbach mobility criterion, Eq. (1.1), the mobility of the mechanism is

$$m = 3(7-1) - 2(8) - 1(1) = 1 \qquad \textit{Ans.}$$

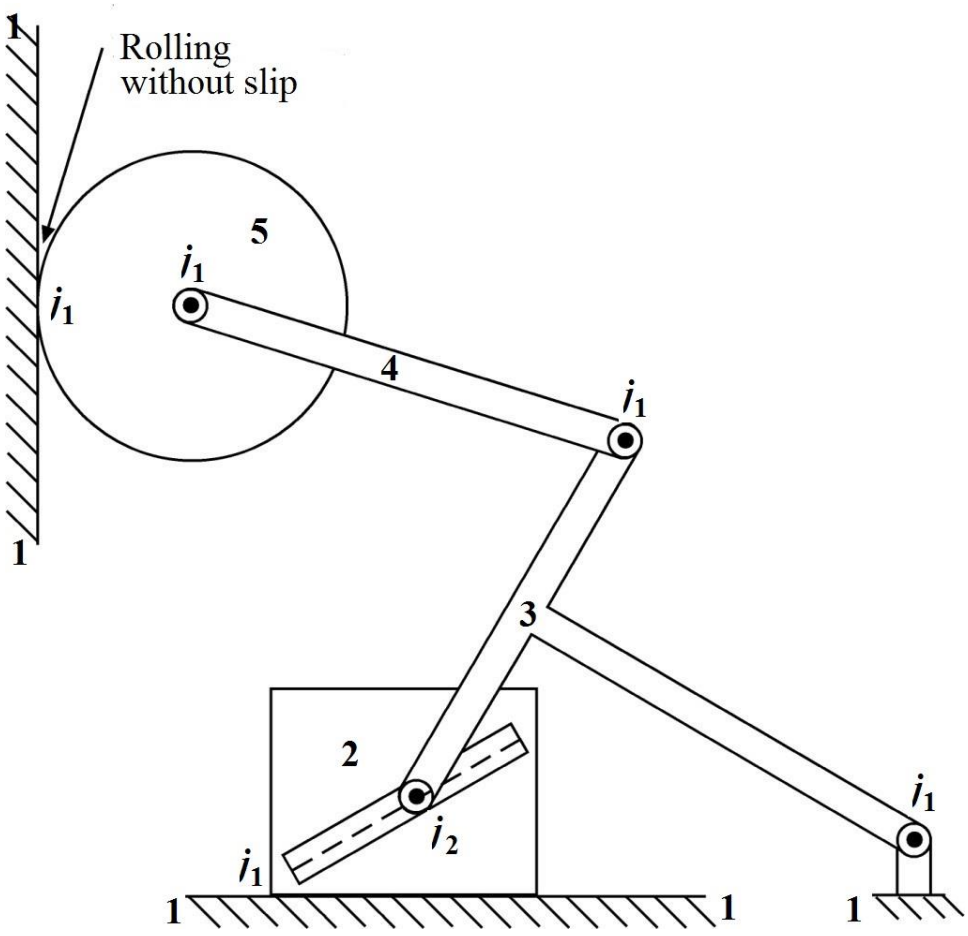

This is the correct answer for this mechanism; that is, for a single input value there is a unique posture.

Rotation of either link 2 or link 3 would be suitable as inputs since these are pinned to the ground link. Translation of the slider (link 4) would also be suitable as an input. Other choices for the input are not particularly practical. *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

1.22 Determine the mobility of the mechanism. Number each link and label the lower pairs and the higher pairs. Identify a suitable input, or inputs, for the mechanism.

The mechanism has 5 links and the joint types are illustrated in the figure below. *Ans*

The link numbers and joint types of the mechanism. *Ans.*

The number of links, lower pairs, and higher pairs, respectively, are

$$n = 5,\ j_1 = 5,\ \text{and}\ j_2 = 1.$$

Substituting these values into the Kutzbach mobility criterion, Eq. (1.1), the mobility of the mechanism is

$$m = 3(5-1) - 2(5) - 1(1) = 1 \qquad \textit{Ans.}$$

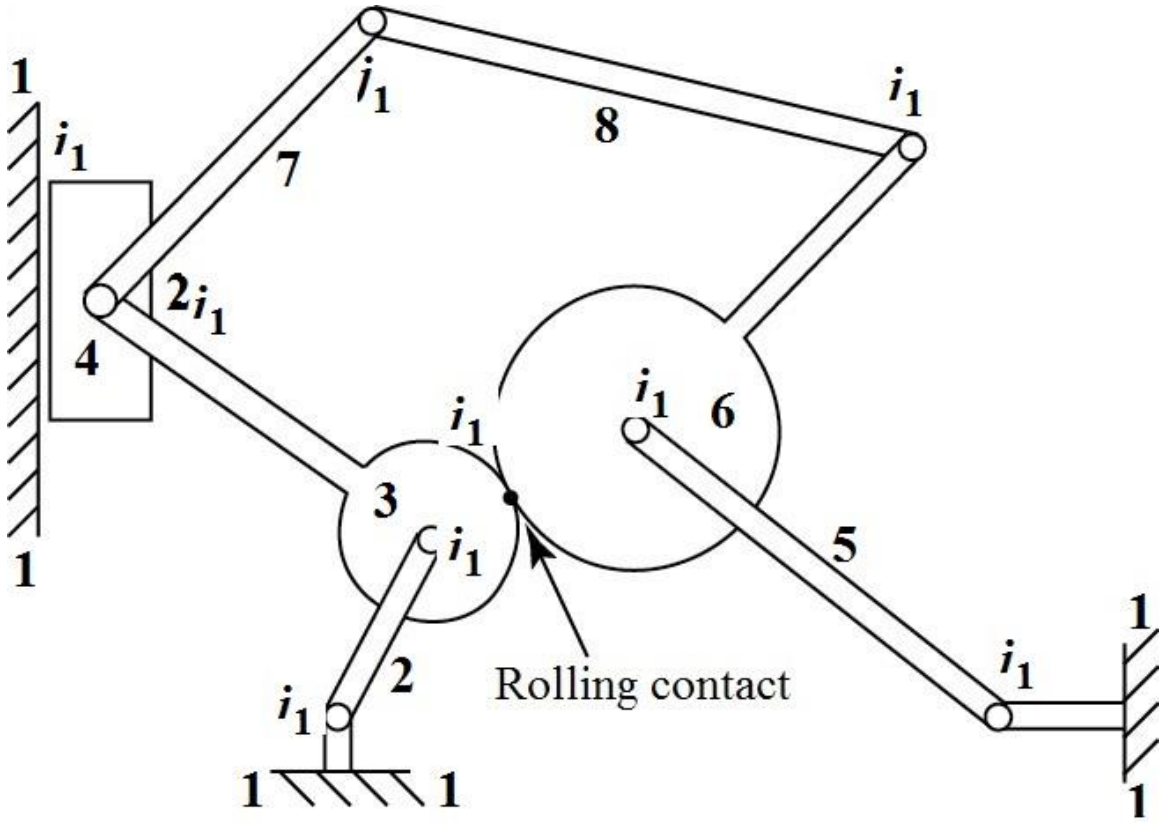

This is the correct answer for this mechanism, that is, for a single input value there is a unique posture.

Rotation of link 3 would be a suitable input since it is pinned to the ground link. Translation of the slider (link 2) would also be suitable as an input. Other choices for the input are not particularly practical. *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

1.23 Determine the mobility of the mechanism. Number each link and label the lower pairs and the higher pairs. Identify a suitable input, or inputs, for the mechanism.

The mechanism has 5 links and the joint types are illustrated in the figure below. *Ans*

The link numbers and joint types of the mechanism. *Ans.*

The number of links, lower pairs, and higher pairs, respectively, are

$$n = 8, j_1 = 10, \text{ and } j_2 = 0.$$

Substituting these values into the Kutzbach mobility criterion, Eq. (1.1), the mobility of the mechanism is

$$m = 3(8-1) - 2(10) - 1(0) = 1 \qquad \textit{Ans.}$$

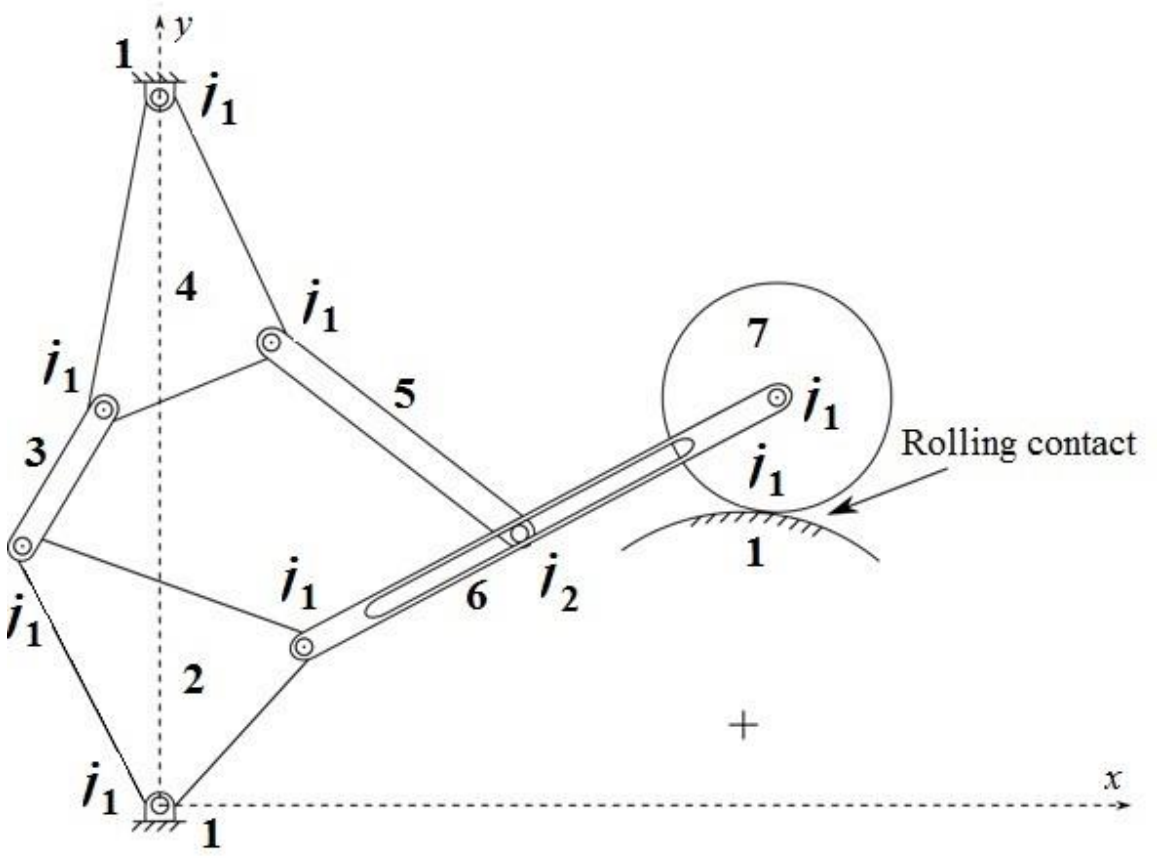

This is the correct answer for this mechanism; that is, for a single input value there is a unique posture.

Rotation of either link 2 or link 5 would be suitable inputs since they are pinned to the ground link. Translation of the slider (link 4) would also be a suitable input. Other choices for the input are not particularly practical. *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

1.24 Determine the mobility of the mechanism. Number each link and label the lower pairs and the higher pairs. Identify a suitable input, or inputs, for the mechanism.

The mechanism has 7 links and the joint types are illustrated in the figure below. *Ans*

The link numbers and joint types of the mechanism. *Ans.*

The number of links, lower pairs, and higher pairs, respectively, are

$$n = 7,\ j_1 = 8, \text{ and } j_2 = 1.$$

Substituting these values into the Kutzbach mobility criterion, Eq. (1.1), the mobility of the mechanism is

$$m = 3(7-1) - 2(8) - 1(1) = 1 \qquad \textit{Ans.}$$

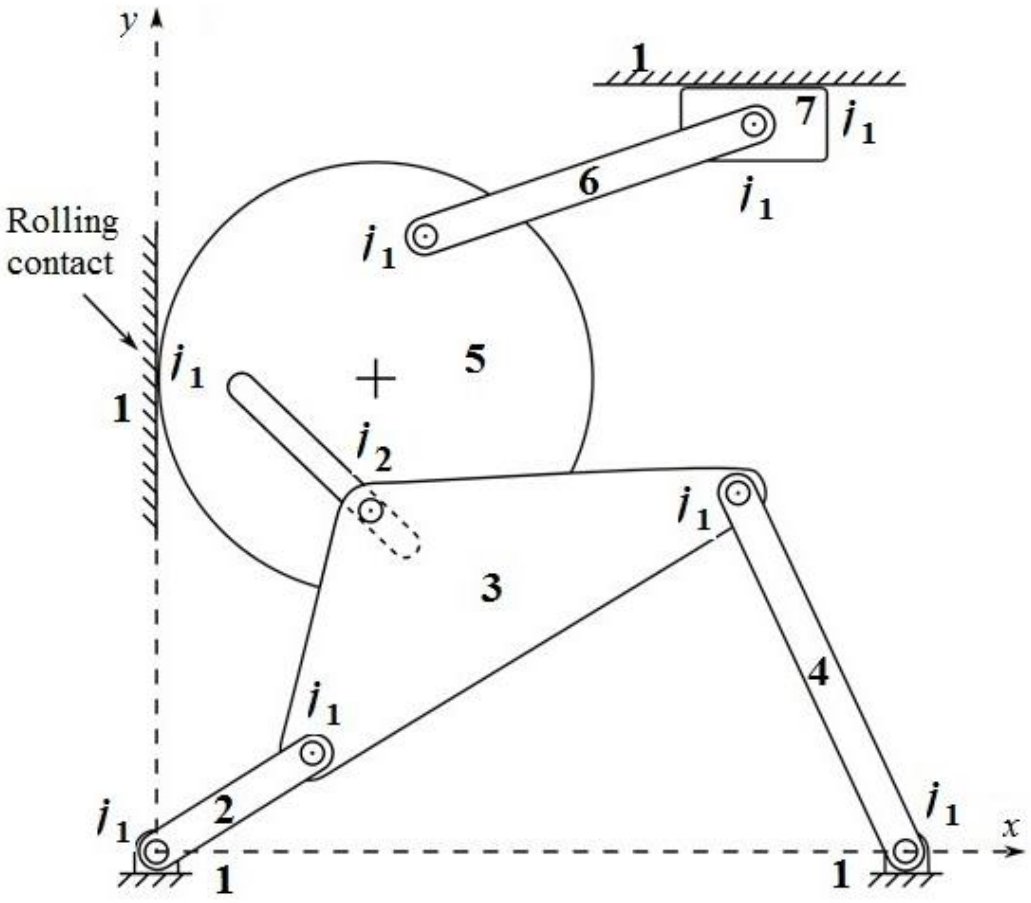

This is the correct answer for this mechanism; that is, for a single input value there is a unique posture.

Rotation of either link 2 or link 4 would be suitable inputs since they are pinned to the ground link. Other choices for the input are not particularly practical. *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

1.25 Determine the mobility of the mechanism. Number each link and label the lower pairs and the higher pairs. Identify a suitable input, or inputs, for the mechanism.

The mechanism has 7 links and the joint types are illustrated in the figure below. *Ans.*

The link numbers and joint types of the mechanism. *Ans.*

The number of links, lower pairs, and higher pairs, respectively, are

$$n = 7,\ j_1 = 8, \text{ and } j_2 = 1.$$

Substituting these values into the Kutzbach mobility criterion, Eq. (1.1), the mobility of the mechanism is

$$m = 3(7-1) - 2(8) - 1(1) = 1 \qquad \textit{Ans.}$$

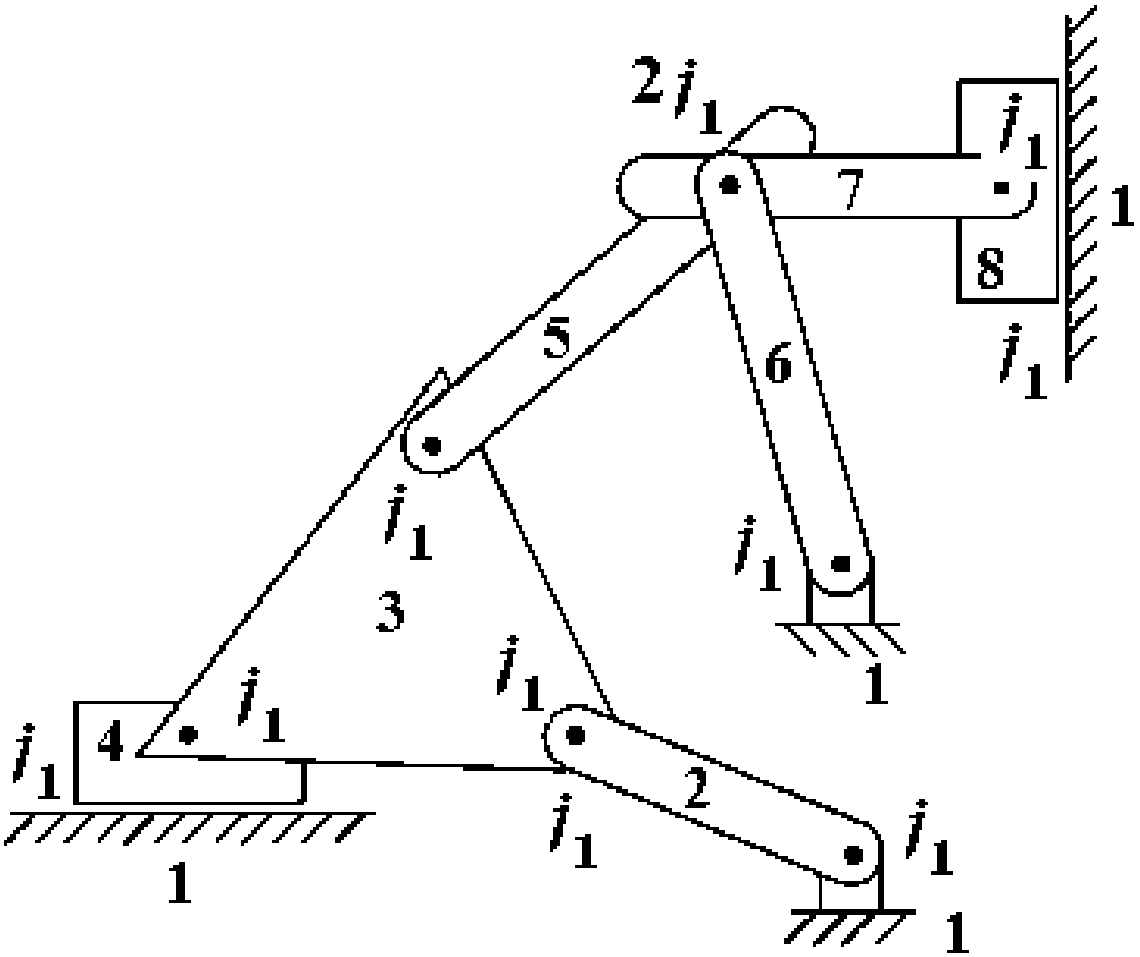

This is the correct answer for this mechanism; that is, for a single input value there is a unique posture.

Rotation of either link 2 or link 4 would be suitable inputs since they are pinned to the ground link. Translation of the slider (link 7) would also be suitable as an input. Other choices for the input are not particularly practical. *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

1.26 Determine the mobility of the mechanism. Number each link and label the lower pairs and the higher pairs. Identify a suitable input, or inputs, for the mechanism.

The mechanism has 8 links and the joint types are illustrated in the figure below. *Ans*

The link numbers and joint types of the mechanism. *Ans.*

The number of links, lower pairs, and higher pairs, respectively, are

$$n = 8,\ j_1 = 10,\ \text{and}\ j_2 = 0.$$

Note that the double-pin joint between links 5, 6, and 7 is counted as 2 j_1 joints.

Substituting these values into the Kutzbach mobility criterion, Eq. (1.1), the mobility of the mechanism is

$$m = 3(8-1) - 2(10) - 1(0) = 1 \qquad \textit{Ans.}$$

This is the correct answer for this mechanism; that is, for a single input value there is a unique posture.

Rotation of either link 2 or link 6 would be suitable inputs since they are pinned to the ground link. Translation of either of the sliders (link 4 or link 8) would also be suitable as inputs. Other choices for the input are not particularly practical. *Ans.*

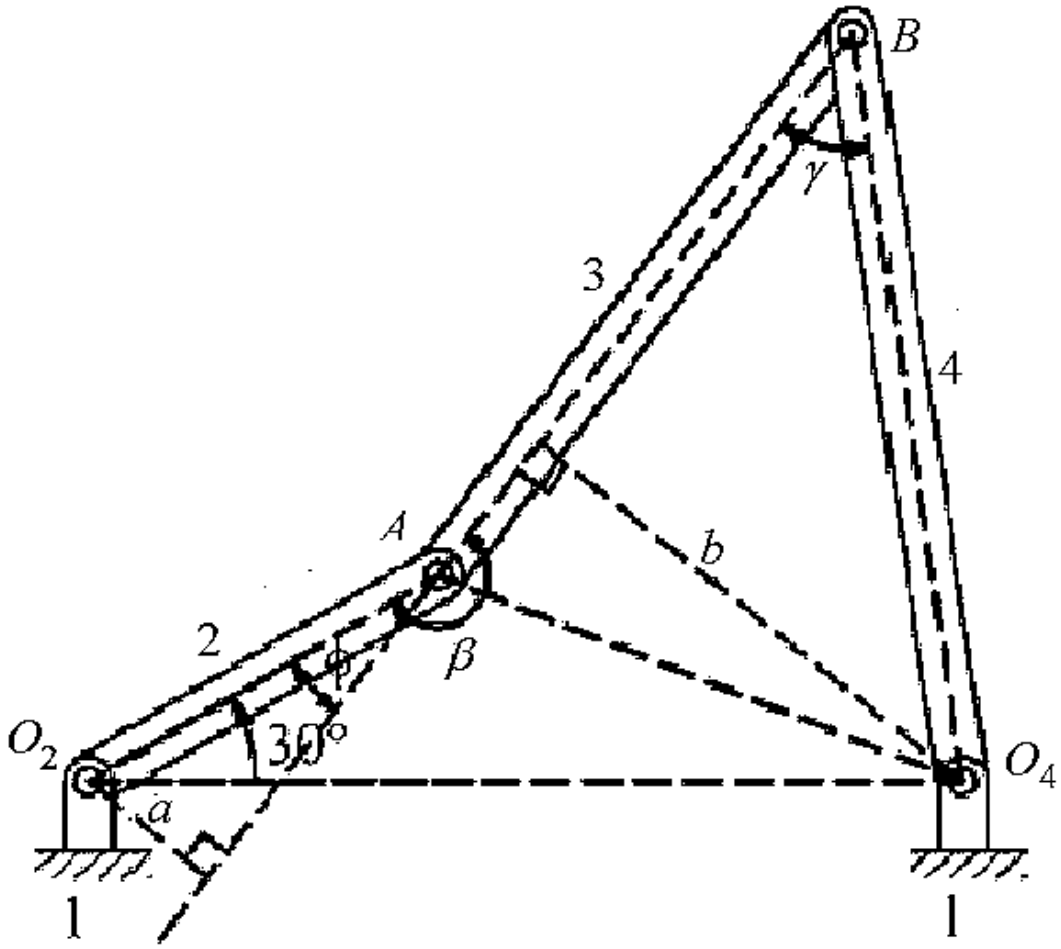

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

1.27 Determine the mechanical advantage of the four-bar linkage in the posture illustrated.

The mechanical advantage, Eq. (3.41), can be written as

$$MA = \frac{b}{a} = \frac{R_{BO_4} \sin\gamma}{R_{AO_2} \sin\phi} = -\frac{R_{BO_4} \sin\gamma}{R_{AO_2} \sin\beta} \tag{1}$$

where the angles β, γ, and ϕ are as shown in Fig. P1.27.

$O_2O_4 = 120$ mm, $O_2A = 60$ mm, $AB = 100$ mm, and $O_4B = 130$ mm.

.

To determine the angles β, ϕ, and γ, the law of cosines for the triangle O_2AO_4 can be written as

$$\overline{AO_4}^2 = R_{O_4O_2}^2 + R_{AO_2}^2 - 2R_{O_4O_2}R_{AO_2}\cos(\measuredangle O_4O_2A)$$

$$= (120\text{ mm})^2 + (60\text{ mm})^2 - 2(120\text{ mm})(60\text{ mm})\cos 30° = 5529.234\ \mu\text{m}^2$$

Therefore,

$$\overline{AO_4} = 74.359\text{ mm}$$

The law of sines for the triangle O_2AO_4 can be written as

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

$$\frac{\overline{AO_4}}{\sin(\measuredangle AO_2O_4)} = \frac{R_{O_2O_4}}{\sin(\measuredangle O_2AO_4)}$$

Rearranging this equation gives

$$\sin(\measuredangle O_2AO_4) = \frac{R_{O_2O_4}}{AO_4}\sin(\measuredangle AO_2O_4) = \frac{120\text{ mm}}{74.359\text{ mm}}\sin 30° = 0.8069$$

Therefore, the angle is either

$\measuredangle O_2AO_4 = 53.79°$ or $\measuredangle O_2AO_4 = 126.21°$

Note that $\measuredangle O_2AO_4 = 53.79°$ can be eliminated since it is not a physically possible result for the open configuration of the four-bar linkage. Therefore, the correct result for the angle is

$$\measuredangle O_2AO_4 = 126.21° \tag{2}$$

The law of cosines for the triangle ABO_4 can be written as

$$R_{BO_4}^2 = R_{BA}^2 + \overline{AO_4}^2 - 2R_{BA}\overline{AO_4}\cos(\measuredangle O_4AB)$$

Rearanging this equation gives

$$\cos(\measuredangle O_4AB) = \frac{(100\text{ mm})^2 + (74.359\text{ mm})^2 - (130\text{ mm})^2}{2(100\text{ mm})(74.359\text{ mm})} = -0.092\,17$$

Therefore, the angle is either

$\measuredangle O_4AB = 95.29°$ or $\measuredangle O_4AB = -84.71°$

Note that the value $\measuredangle O_4AB = -84.71°$ can be eliminated since it is not physically possible for the open configuration of the four-bar linkage. Therefore, the correct result is

$$\measuredangle O_4AB = 95.29° \tag{3}$$

The angle

$$\beta = \measuredangle O_2AO_4 + \measuredangle O_4AB \tag{4}$$

Substituting Eqs. (2) and (3) into Eq. (4) gives

$$\beta = 126.21° + 95.29° = 221.50° \tag{5}$$

The law of cosines for the triangle ABO_4 can be written as

$$\overline{AO_4}^2 = R_{BA}^2 + R_{BO_4}^2 - 2R_{BA}R_{BO_4}\cos\gamma$$

Rearanging this equation gives

$$\cos\gamma = \frac{(100\text{ mm})^2 + (130\text{ mm})^2 - (74.359\text{ mm})^2}{2(100\text{ mm})(130\text{ mm})} = 0.821\,95$$

Therefore, the transmission angle is

$$\gamma = 34.72° \tag{6}$$

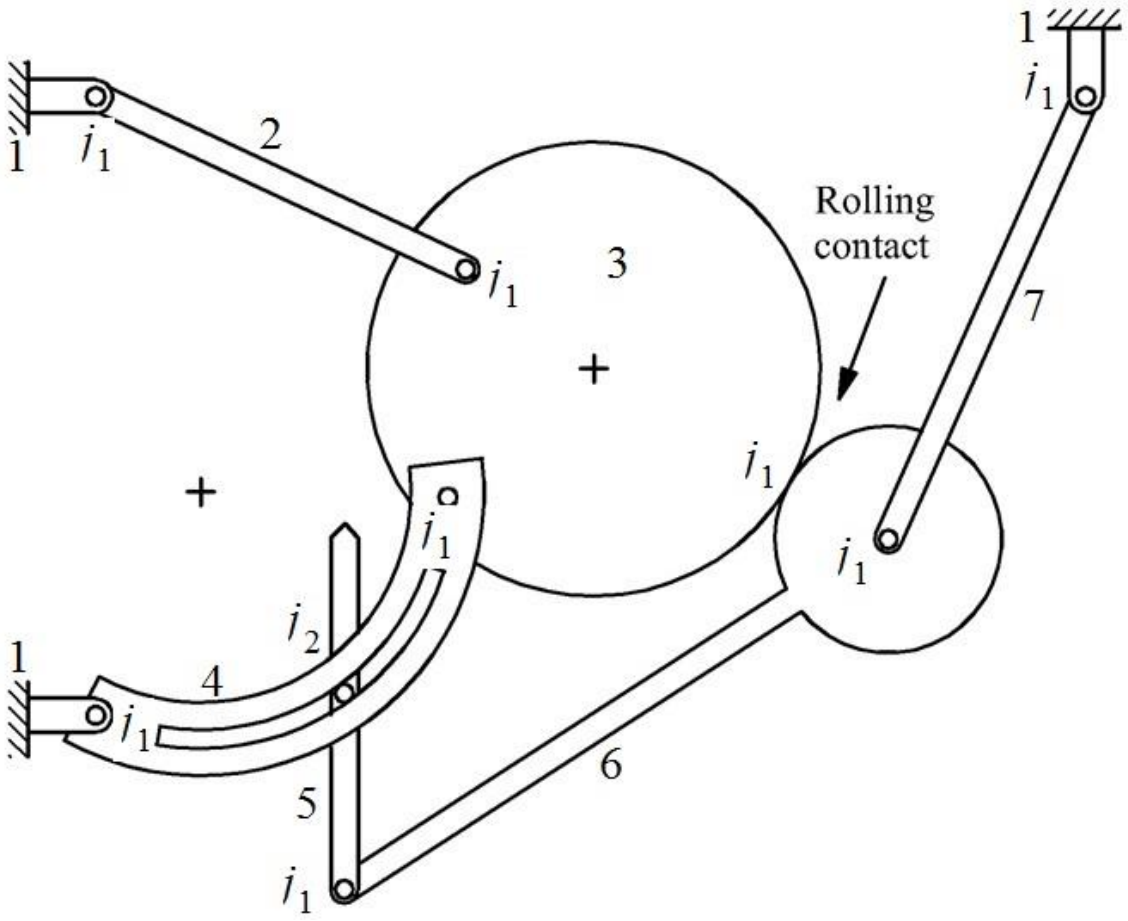

Substituting Eqs. (5) and (6) into Eq. (1), the mechanical advantage is

$$MA = -\frac{(130\text{ mm})\sin 34.72^o}{(60\text{ mm})\sin 221.50^o} = -\frac{74.044\text{ mm}}{-39.757\text{ mm}} = 1.86 \qquad \underline{\textit{Ans.}}$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

1.28 Determine the mobility of the mechanism. Number each link and label the lower pairs and the higher pairs. Identify a suitable input, or inputs, for the mechanism.

The mechanism has 7 links and the joint types are indicated in the figure below *Ans.*

The link numbers and joint types of the mechanism. *Ans.*

The number of links, lower pairs, and higher pairs, respectively, are

$$n = 7,\ j_1 = 8,\ \text{and}\ j_2 = 1.$$

Substituting these values into the Kutzbach mobility criterion, Eq. (1.1), the mobility of the mechanism is

$$m = 3(7-1) - 2(8) - 1(1) = 1 \qquad \textit{Ans.}$$

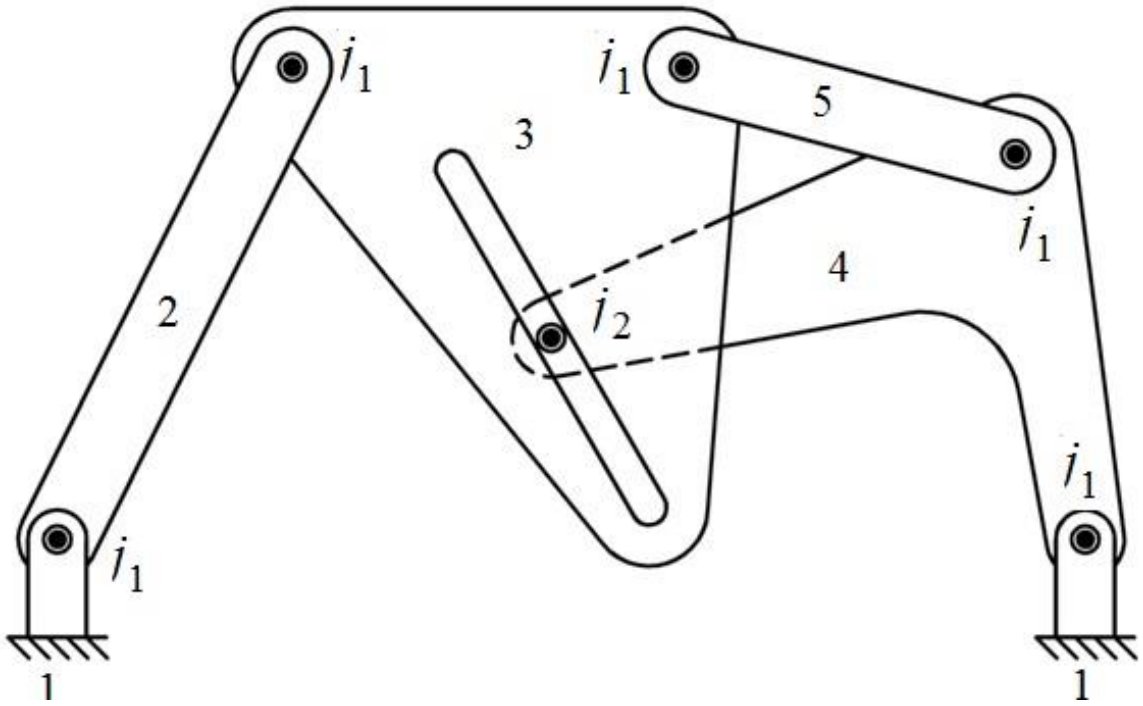

This is the correct answer for this mechanism; that is, for a single input value there is a unique posture.

Rotation of either link 2, link 4, or link 7 would be suitable inputs since they are each pinned to the ground link. Other choices for the input are not particularly practical. *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

1.29 Determine the mobility of the mechanism. Number each link and label the lower pairs and the higher pairs. Identify a suitable input, or inputs, for the mechanism.

The mechanism has 7 links and the joint types are illustrated in the figure below. *Ans.*

The link numbers and joint types of the mechanism. *Ans.*

The number of links, lower pairs, and higher pairs, respectively, are

$$n = 5, j_1 = 5, \text{ and } j_2 = 1.$$

Substituting these values into the Kutzbach mobility criterion, Eq. (1.1), the mobility of the mechanism is

$$m = 3(5-1) - 2(5) - 1(1) = 1 \qquad \textit{Ans.}$$

This is the correct answer for this mechanism; that is, for a single input value there is a unique posture.

Rotation of either link 2 or link 4 would be suitable inputs since they are each pinned to the ground link. Other choices for the input are not particularly practical. *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

1.30 The rocker of a crank-rocker four-bar linkage is required to have a length of 6 in and swing through a total angle of 30°. Also, the advance-to-return ratio of the linkage is required to be 1.75. Determine a suitable set of link lengths for the remaining three links.

The advance-to-return-ratio must be

$$Q = \alpha/\beta = 1.75 \tag{1}$$

where

$$\alpha = 180^\circ + \phi \qquad \text{and} \qquad \beta = 180^\circ - \phi \tag{2}$$

Substituting Eqs. (2) into Eq. (1) gives

$$180° + \phi = 1.75(180° - \phi)$$

Therefore,

$$\phi = 49.09°$$

$$\beta = 130.91^\circ \qquad \text{and} \qquad \alpha = 229.09°$$

Note that the dimensions of the synthesized four-bar linkage to satisfy the given design constraints are not unique. However, the graphic procedure follows the steps shown in Example 1.4. (For this problem, refer to the figure below):

(1) Draw the rocker $r_4 = 6$ in of the crank-rocker four-bar linkage to a suitable scale, for example, full scale. Draw the rocker in the two extreme positions, that is, show the swing angle of the rocker of 30 degrees. Label the ground pivot O_4 and label the pin B in the two positions B_1 and B_2.

(2) Through point B_1 draw an arbitrary line (labeled the X-line). Through B_2 draw a line parallel to the X-line.

(3) Lay out the angle $\phi = 49.09^\circ$ counterclockwise from the X-line through point B_1. The intersection of this line with the line parallel to the X-line through point B_2 is the input crank pivot O_2.

(4)*i* The length O_2O_4 of the ground link can be measured from the drawing. That is

$$r_1 = O_2O_4 = 8.94 \text{ in} \qquad \underline{\textit{Ans.}}$$

The other measurements are

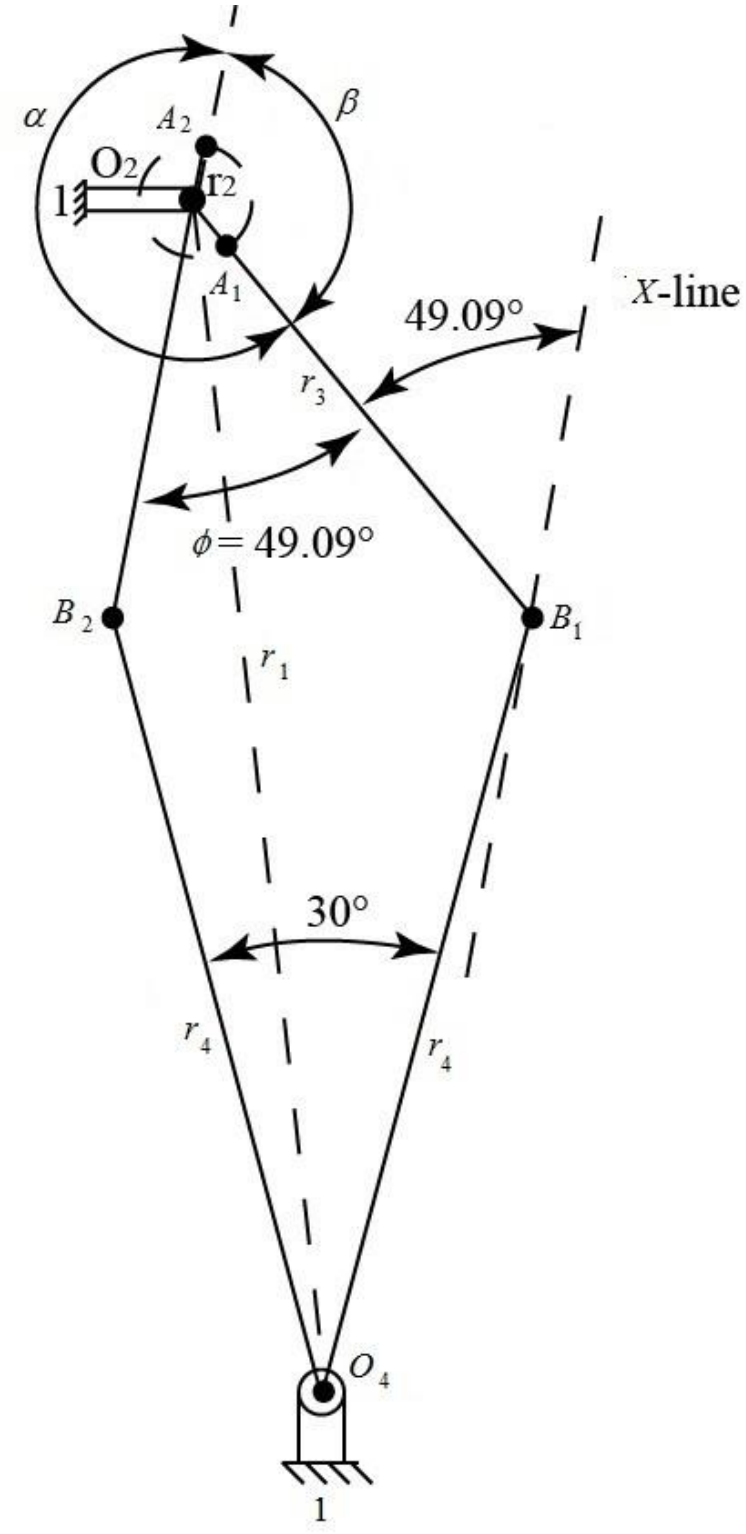

$O_2B_1 = r_3 + r_2 = 4.02$ in and $O_2B_2 = r_3 - r_2 = 3.18$ in

Therefore, the length of the input link and the length of the coupler link, respectively, must be

$r_2 = O_2A = 0.42$ in and $r_3 = AB = 3.60$ in $\qquad \underline{\textit{Ans.}}$

This solution of the synthesized four-bar linkage is shown in the figure below.

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

The synthesized four-bar linkage.

1.31 Determine a suitable set of link lengths for a slider-crank linkage such that the stroke will be 500 mm and the advance-to-return ratio will be 1.8.

The advance-to-return ratio must be

$$Q = \alpha/\beta = 1.8 \tag{1}$$

where

$$\alpha = 180^\circ + \phi \qquad \text{and} \qquad \beta = 180^\circ - \phi \tag{2}$$

Substituting Eqs. (2) into Eq. (1) gives

$$180° + \phi = 1.8(180° - \phi)$$

Therefore,

$$\phi = 51.43°$$

$$\beta = 128.57^\circ \qquad \text{and} \qquad \alpha = 231.43°$$

Note that the dimensions of the synthesized slider-crank linkage to satisfy the given design constraints are not unique. However, the graphic procedure follows the steps shown in Example 1.5. (For this problem, refer to the figure below):

(1) Draw the stroke of the slider-crank linkage to a suitable scale, for example, 1 in ~ 100 mm. The length of the stroke of this mechanism is specified as $r_4 = 500$ mm. Label the pin B in its two extreme positions as B_1 and B_2.

(2) Through point B_2 draw an arbitrary line (labeled the X-line). Through point B_1 draw a line parallel to the X-line.

(3) Lay out the angle $\phi = 51.43^\circ$ clockwise from the X-line. The intersection of this line with the line parallel to the X-line through point B_1 is the ground pivot O_2.

(4) From the scale drawing below, the ground link; i.e., the offset (the vertical distance), is measured as

$$r_1 = 102.5 \text{ mm} \qquad \underline{\textit{Ans.}}$$

The other measurements are

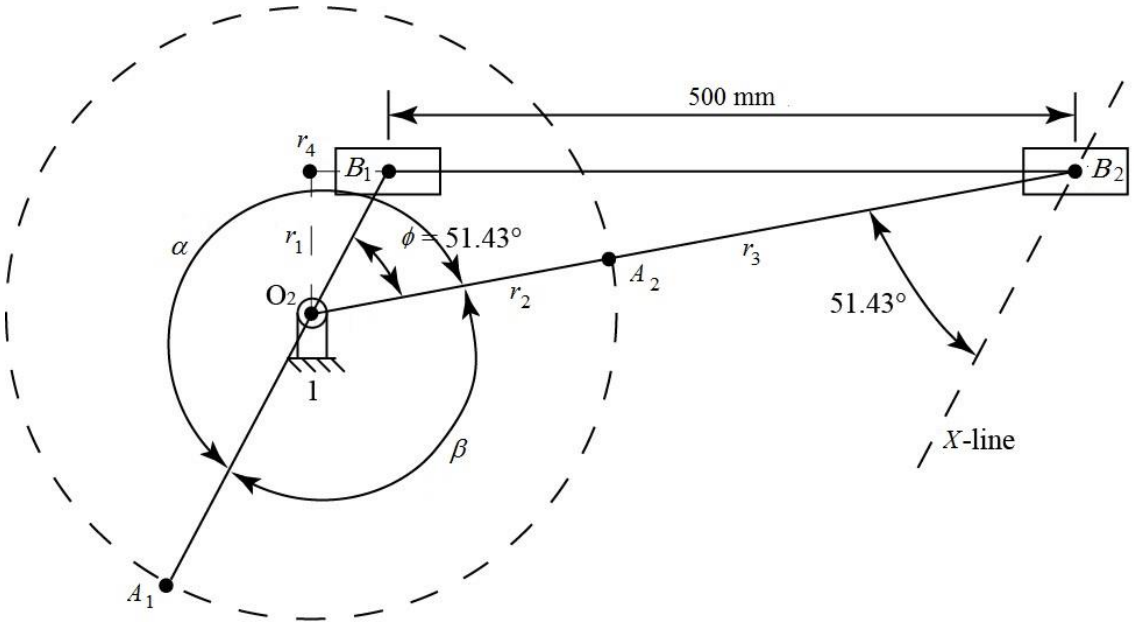

$O_2B_2 = r_3 + r_2 = 562.5$ mm and $O_2B_1 = r_3 - r_2 = 118.5$ mm

Therefore, the length of the input link and the length of the coupler link, respectively, are

$r_2 = O_2A = 222$ mm and $r_3 = AB = 340.5$ mm $\qquad \underline{\textit{Ans.}}$

The solution of the synthesized slider-crank linkage is shown in the figure below.

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

The synthesized slider-crank linkage.

1.32 Determine the transmission angle and the mechanical advantage of the four-bar linkage in the posture illustrated. What type of four-bar linkage is this?

Grashof's law for a planar four-bar linkage, Sec. 1.9, Eq. (1.6), states that in order for the four-bar linkage to be a Grashof chain, the dimensions must satisfy

$$s + l \le p + q \tag{1}$$

The lengths of the four links of the four-bar linkage are

$s = 20$ mm, $l = 90$ mm, $p = 60$ mm, and $q = 70$ mm..

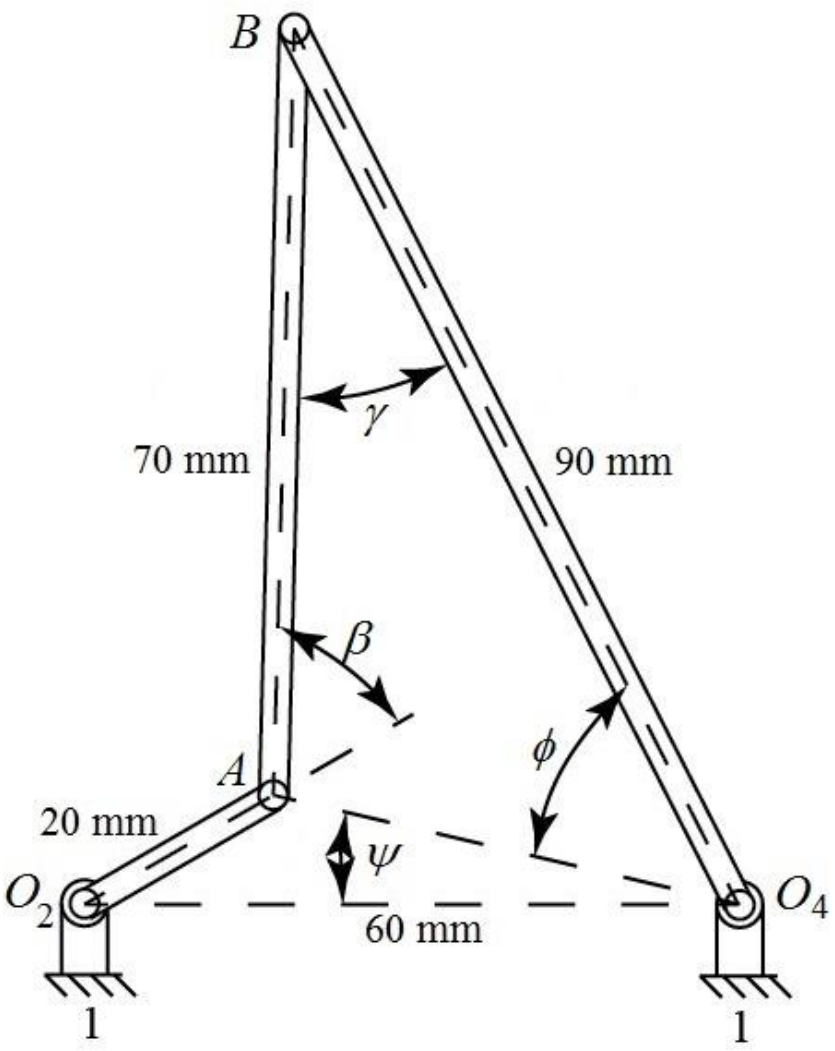

Substituting these dimensions into Eq. (1) gives

$$20 \text{ mm} + 90 \text{ mm} \le 60 \text{ mm} + 70 \text{ mm}$$

or

$$110 \text{ mm} \le 130 \text{ mm}$$

Since this inequality is satisfied, the four-bar linkage is a Grashof chain. Also, since the shortest link s is adjacent to the ground link, the shortest link is a crank; see Sec. 1.9. Therefore, this is a crank-rocker four-bar linkage. *Ans.*

$r_2 = 20$ mm, $r_3 = 70$ mm, $r_4 = 90$ mm, and $r_1 = 60$ mm.

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

In the posture illustrated, the distance between points A and O_4 can be found from the triangle AO_2O_4. The law of cosines can be written as

$$\overline{AO_4}^2 = r_2^2 + r_1^2 - 2r_2 r_1 \cos\theta_2$$

Substituting the given dimensions gives

$$\overline{AO_4}^2 = (20\text{ mm})^2 + (60\text{ mm})^2 - 2(20\text{ mm})(60\text{ mm})\cos 30^\circ = 1\,921.54\,(\text{mm})^2$$

Therefore, $\overline{AO_4} = 43.84$ mm.

To determine the transmission angle γ consider the triangle ABO_4. The law of cosines can be written as

$$\overline{AO_4}^2 = r_3^2 + r_4^2 - 2r_3 r_4 \cos\gamma$$

Substituting the given dimensions gives

$$1921.54\,(\text{mm})^2 = (70\text{ mm})^2 + (90\text{ mm})^2 - 2(70\text{ mm})(90\text{ mm})\cos\gamma$$

This equation gives $\cos\gamma = 0.879\,24$

Therefore, the transmission angle is $\gamma = 28.45^\circ$ *Ans.* (2)

The angle ψ can be found from the triangle O_2O_4A. From the law of sines,

$$\psi = \sin^{-1}\left[\frac{(20\text{ mm})\sin 30^\circ}{43.84\text{ mm}}\right] = 13.19^\circ$$

To determine the angle ϕ, consider the triangle BO_4A. From the law of sines, this angle is

$$\phi = \sin^{-1}\left[\frac{(70\text{ mm})\sin 28.45^\circ}{43.84\text{ mm}}\right] = 49.52^\circ$$

The angle between link 3 (link AB) and the ground link O_2O_4 can be written as

$$\theta_3 = 180^o - \gamma - \phi - \psi = 180^o - 28.45^o - 49.52^o - 13.19^o = 88.84^o$$

The angle β can be written as

$$\beta = \theta_3 - 30^\circ = 88.84^\circ - 30^\circ = 58.84^\circ \quad (3)$$

The mechanical advantage of a four-bar linkage, Sec.1.10, can be written as

$$MA = \frac{r_4 \sin\gamma}{r_2 \sin\beta}$$

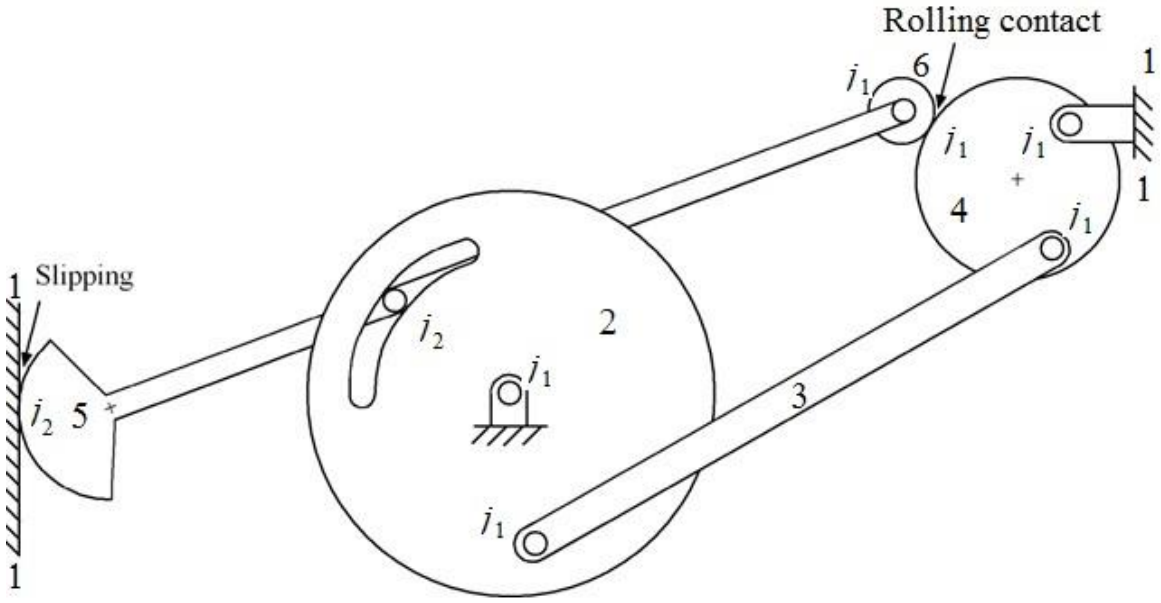

Substituting Eqs. (2) and (3), and the given link lengths, the mechanical advantage of the four-bar linkage (in the given posture) is

$$MA = \frac{(90\text{ mm})\sin 28.45^o}{(20\text{ mm})\sin 58.84^o} = 2.51 \quad \textit{Ans.}$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

1.33 Determine the mobility of the mechanism. Number each link and label the lower pairs and the higher pairs. Identify a suitable input, or inputs, for the mechanism.

The mechanism has 6 links and the joint types are illustrated in the following figure *Ans.*

The link numbers and joint types of the mechanism. *Ans.*

The number of links, lower pairs, and higher pairs, respectively, are

$$n = 6,\ j_1 = 6, \text{ and } j_2 = 2.$$

Substituting these values into the Kutzbach mobility criterion, Eq. (1.1), the mobility of the mechanism is

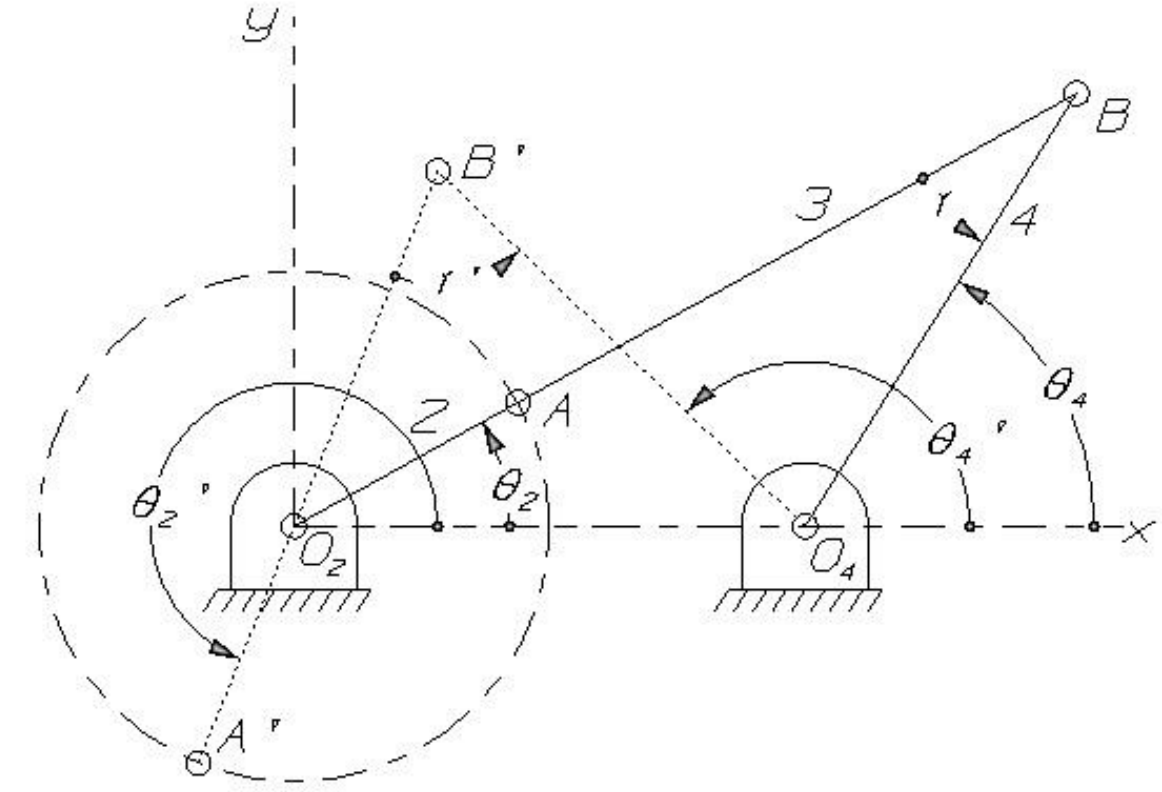

$$m = 3(6-1) - 2(6) - 1(2) = 1 \qquad \textit{Ans.}$$

This is the correct answer for this mechanism; that is, for a single input value there is a unique posture.

The rotation of either link 2 or link 4 would be suitable inputs since they are pinned to the ground link. Other choices for the input are not particularly practical. *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

1.34 A crank-rocker four-bar linkage is illustrated in one of its two toggle postures. Find θ_2 and θ_4 corresponding to each toggle posture. What is the total rocking angle of link 4? What are the transmission angles at the extremes?

$r_2 = 8$ in, $r_3 = 20$ in, and $r_4 = r_1 = 16$ in.

(*a*) From isosceles triangle O_4O_2B we can calculate

$$\theta_2 = \cos^{-1}\frac{(r_2 + r_3)/2}{r_1} = \cos^{-1}\frac{8\text{ in} + 20\text{ in}}{2(16\text{ in})} = 28.955^\circ,\ \theta_4 = 57.910^\circ, \qquad \underline{\textit{Ans.}}$$

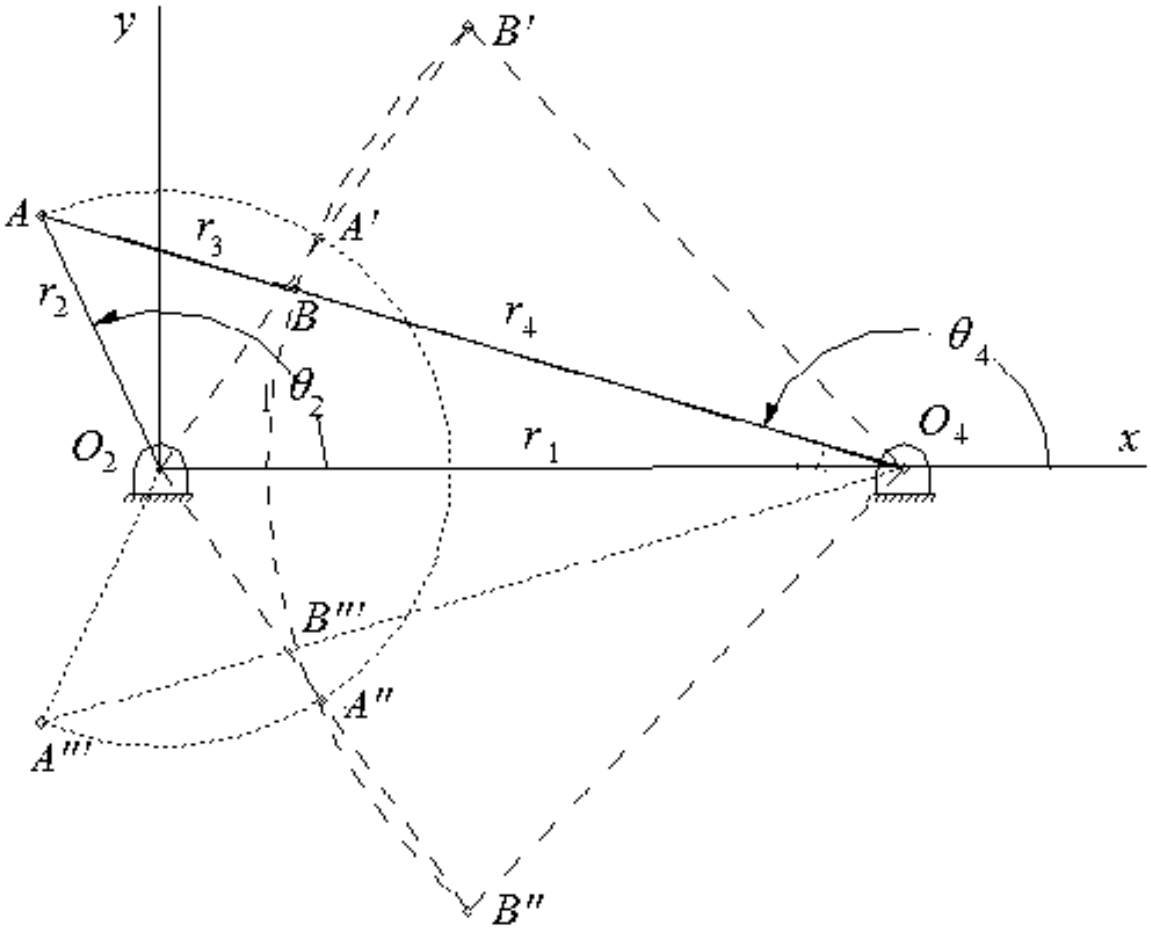

$$\theta_2' = \cos^{-1}\frac{r_3 - r_2}{2r_1} = \cos^{-1}\frac{20\text{ in} - 8\text{ in}}{2(16\text{ in})} = 247.976^\circ,\ \theta_4' = 135.951^\circ\ . \qquad \underline{\textit{Ans.}}$$

(*b*) Then $\Delta\theta_4 = \theta_4' - \theta_4 = 78.041^\circ$ $\underline{\textit{Ans.}}$

(*c*) Finally, from isosceles triangle O_2BO_4, $\gamma = 28.955^\circ$ and $\gamma' = 67.976^\circ$. $\underline{\textit{Ans.}}$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

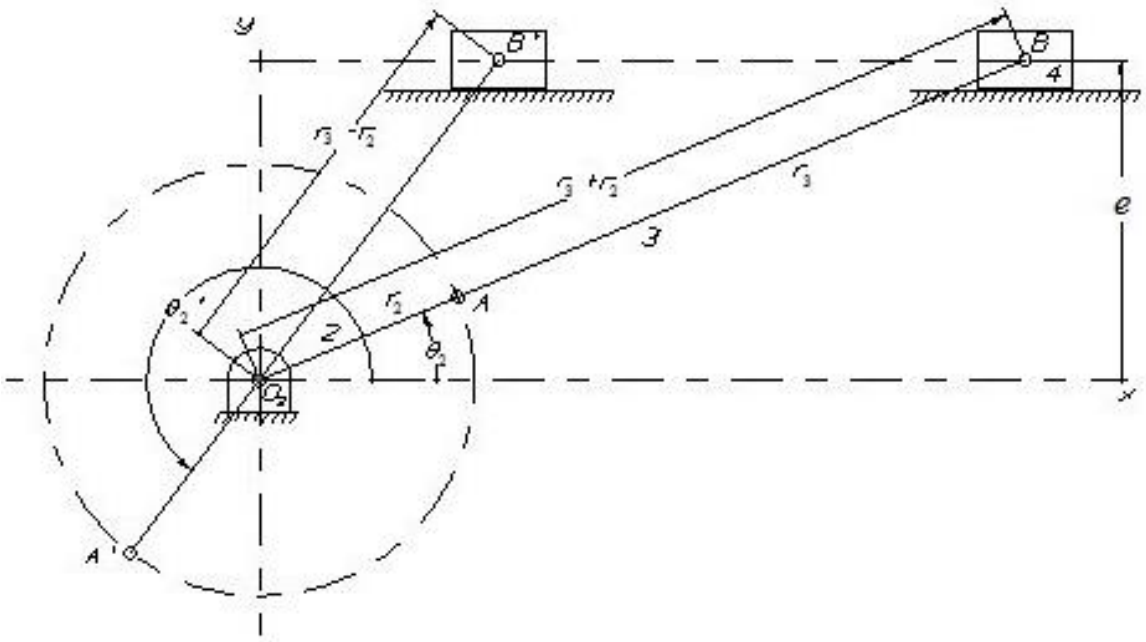

1.35 Find θ_2 and θ_4 corresponding to a dead-center posture. Is there a toggle posture?

$r_2 = 110$ mm, $r_3 = 100$ mm, $r_4 = 240$ mm, and $r_1 = 280$ mm.

For the given dimensions, there are two dead-center postures, and they correspond to the two extreme travel postures of crank O_2A. From ΔO_4AO_2 using the law of cosines, we can find $\theta_2 = 114.05°$, $\theta_4 = 162.82°$ and, symmetrically, $\theta_2''' = -114.05°$, $\theta_4''' = -162.82°$. There are also two toggle postures; these occur at $\theta_2' = 56.50°$, $\theta_4' = 133.14°$ and, symmetrically, at $\theta_2'' = -56.50°$, $\theta_4'' = -133.14°$. *Ans.*

1.36 Determine the advance-to-return ratio for the slider-crank linkage with the offset e. Also, determine in which direction the crank should rotate to provide quick return.

An offset slider-crank linkage in the two dead-center postures.

From the figure we can see that $e = (r_3 + r_2)\sin\theta_2 = (r_3 - r_2)\sin(\theta_2' - 180°)$ or

$$\theta_2 = \sin^{-1}\left(\frac{e}{r_3 + r_2}\right), \qquad \theta_2' = 180° + \sin^{-1}\left(\frac{e}{r_3 - r_2}\right)$$

$$\Delta\theta_{drive} = \theta_2' - \theta_2 = 180° + \sin^{-1}\left(\frac{e}{r_3 - r_2}\right) - \sin^{-1}\left(\frac{e}{r_3 + r_2}\right)$$

$$\Delta\theta_{return} = \theta_2 + 360° - \theta_2' = 180° + \sin^{-1}\left(\frac{e}{r_3 + r_2}\right) - \sin^{-1}\left(\frac{e}{r_3 - r_2}\right)$$

The advance-to-return ratio is

$$Q = \frac{180° + \sin^{-1}\left(\frac{e}{r_3 - r_2}\right) - \sin^{-1}\left(\frac{e}{r_3 + r_2}\right)}{180° + \sin^{-1}\left(\frac{e}{r_3 + r_2}\right) - \sin^{-1}\left(\frac{e}{r_3 - r_2}\right)} \qquad \underline{Ans.}$$

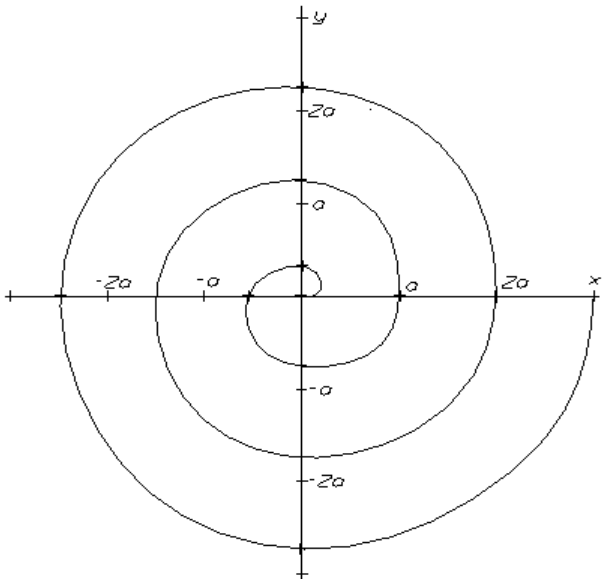

Assuming driving is when B is sliding to the right, the crank should rotate clockwise. <u>*Ans.*</u>

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

Chapter 2
Position and Displacement

2.1 Describe and sketch the locus of a point A which moves according to the equations $R_A^x = at\cos(2\pi t)$, $R_A^y = at\sin(2\pi t)$, and $R_A^z = 0$.

The locus is the spiral shown. *Ans.*

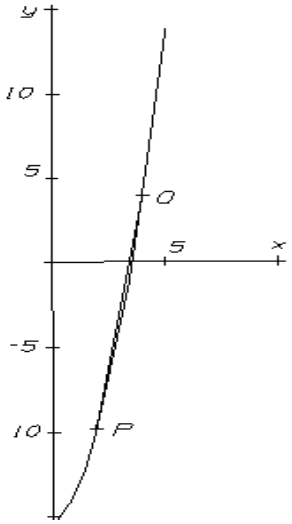

2.2 Find the position difference from point P to point Q on the curve $y = x^2 + x - 16$, where $R_P^x = 2$ and $R_Q^x = 4$.

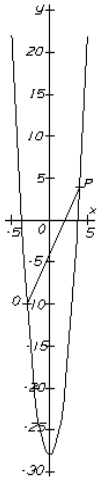

$R_P^y = (2)^2 + 2 - 16 = -10$; $\mathbf{R}_P = 2\hat{\mathbf{i}} - 10\hat{\mathbf{j}}$

$R_Q^y = (4)^2 + 4 - 16 = 4$; $\mathbf{R}_Q = 4\hat{\mathbf{i}} + 4\hat{\mathbf{j}}$

$\mathbf{R}_{QP} = \mathbf{R}_Q - \mathbf{R}_P = 2\hat{\mathbf{i}} + 14\hat{\mathbf{j}} = 14.142\angle 81.87°$ *Ans.*

2.3 The path of a moving point is defined by the equation $y = 2x^2 - 28$. Find the position difference from point P to point Q if $R_P^x = 4$ and $R_Q^x = -3$.

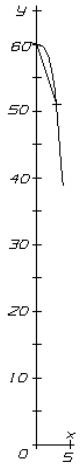

$R_P^y = 2(4)^2 - 28 = 4$; $\quad \mathbf{R}_P = 4\hat{\mathbf{i}} + 4\hat{\mathbf{j}}$

$R_Q^y = 2(-3)^2 - 28 = -10$; $\mathbf{R}_Q = -3\hat{\mathbf{i}} - 10\hat{\mathbf{j}}$

$\mathbf{R}_{QP} = \mathbf{R}_Q - \mathbf{R}_P = -7\hat{\mathbf{i}} - 14\hat{\mathbf{j}} = 15.652\angle 243.43°$ *Ans.*

2.4 The path of a moving point P is defined by the equation $y = 60 - x^3/3$. What is the displacement of the point if its motion begins at $R_P^x = 0$ and ends at $R_P^x = 3$?

$R_P^y(0) = 60 - (0)^3/3 = 60$; $\mathbf{R}_P(0) = 60\hat{\mathbf{j}}$

$R_P^y(3) = 60 - (3)^3/3 = 51$; $\mathbf{R}_P(3) = 3\hat{\mathbf{i}} + 51\hat{\mathbf{j}}$

$\Delta\mathbf{R}_P = \mathbf{R}_P(3) - \mathbf{R}_P(0) = 3\hat{\mathbf{i}} - 9\hat{\mathbf{j}} = 9.487\angle -71.57°$ *Ans.*

2.5 If point A moves on the locus of Problem 2.1, find its displacement from $t = 2$ to $t = 2.5$.

$\mathbf{R}_A(2.0) = 2.0a\cos 4\pi\hat{\mathbf{i}} + 2.0a\sin 4\pi\hat{\mathbf{j}} = 2.0a\hat{\mathbf{i}}$

$\mathbf{R}_A(2.5) = 2.5a\cos 5\pi\hat{\mathbf{i}} + 2.5a\sin 5\pi\hat{\mathbf{j}} = -2.5a\hat{\mathbf{i}}$

$\Delta\mathbf{R}_A = \mathbf{R}_A(2.5) - \mathbf{R}_A(2.0) = -4.5a\hat{\mathbf{i}}$ *Ans.*

2.6 The position of a point is given by the equation $\mathbf{R} = 100e^{j2\pi t}$. What is the path of the point? Determine the displacement of the point from $t = 0.10$ to $t = 0.40$.

The point moves on a circle of radius 100 units with center at the origin. *Ans.*

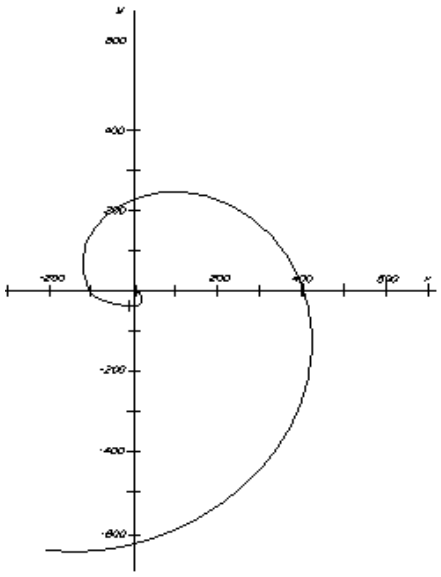

$\mathbf{R}(0.10) = 100e^{j0.628} = 80.902\hat{\mathbf{i}} + 58.779\hat{\mathbf{j}}$

$\mathbf{R}(0.40) = 100e^{j2.513} = -80.902\hat{\mathbf{i}} + 58.779\hat{\mathbf{j}}$

$\Delta\mathbf{R} = \mathbf{R}(0.40) - \mathbf{R}(0.10) = -161.804\hat{\mathbf{i}} = 161.804\angle 180°$ *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

2.7 The equation $\mathbf{R} = \left(t^2 + 4\right)e^{-j\pi t/10}$ defines the position of a point. In which direction is the position vector rotating? Where is the point located when $t = 0$? What is the next value t can have if the orientation of the position vector is to be the same as it is when $t = 0$? What is the displacement from the first position of the point to the second?

Since the polar angle for the position vector is $\theta = -\pi t/10$, then $d\theta/dt$ is negative and therefore the position vector is rotating clockwise. *Ans.*

$$\mathbf{R}(0) = \left(0^2 + 4\right)e^{-j0} = 4\angle 0°$$

The position vector will next have the same orientation when $\pi t/10 = 2\pi$, that is, when t=20. *Ans.*

$$\mathbf{R}(20) = \left(20^2 + 4\right)e^{-j2\pi} = 404\angle 0°$$

$$\Delta\mathbf{R} = \mathbf{R}(20) - \mathbf{R}(0) = 400\angle 0° \qquad \textit{Ans.}$$

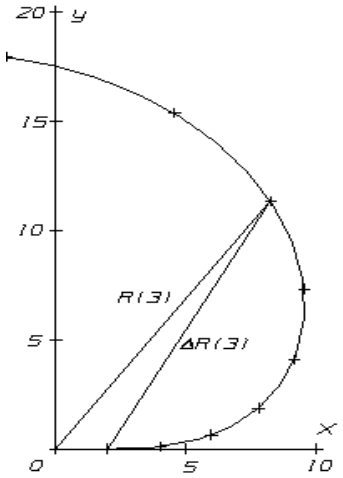

2.8 The location of a point is defined by the equation $\mathbf{R} = (4t + 2)e^{j\pi t^2/30}$, where t is time in seconds. Motion of the point is initiated when $t = 0$. What is the displacement during the first 3 s? Find the change in angular orientation of the position vector during the same time interval.

$$\mathbf{R}(0) = (0 + 2)e^{j0} = 2\angle 0° = 2\hat{\mathbf{i}}$$

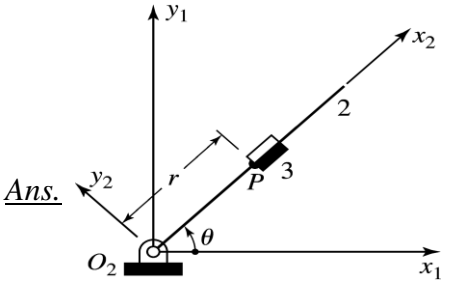

$$\mathbf{R}(3) = (12 + 2)e^{j\pi 9/30} = 14\angle 54° = 8.229\hat{\mathbf{i}} + 11.326\hat{\mathbf{j}}$$

$$\Delta\mathbf{R} = \mathbf{R}(3) - \mathbf{R}(0) = 6.229\hat{\mathbf{i}} + 11.326\hat{\mathbf{j}} = 12.926\angle 61.19° \qquad \textit{Ans.}$$

$$\Delta\theta = 54° - 0° = 54° \text{ ccw} \qquad \textit{Ans.}$$

2.9 Link 2 rotates according to the equation $\theta = \pi t/4$. Block 3 slides outward on link 2 according to the equation $r = t^2 + 2$. What is the absolute displacement $\Delta\mathbf{R}_{P_3}$ from t = 1 to t = 2? What is the apparent displacement $\Delta\mathbf{R}_{P_{3/2}}$?

$$\mathbf{R}_{P_3} = re^{j\theta} = \left(t^2+2\right)e^{j\pi t/4}$$

$$\mathbf{R}_{P_3}(1) = 3\angle 45° = 2.121\hat{\mathbf{i}} + 2.121\hat{\mathbf{j}}$$

$$\mathbf{R}_{P_3}(2) = 6\angle 90° = 6\hat{\mathbf{j}}$$

$$\Delta\mathbf{R}_{P_3} = \mathbf{R}_{P_3}(2) - \mathbf{R}_{P_3}(1) = -2.121\hat{\mathbf{i}} + 3.879\hat{\mathbf{j}} = 4.421\angle 118.67° \quad \underline{Ans.}$$

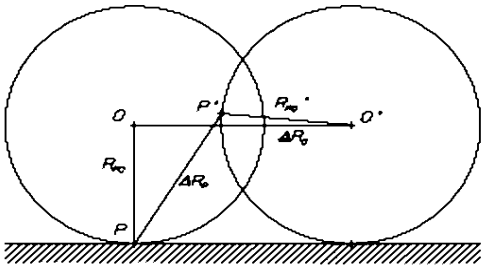

$$\mathbf{R}_{P_3/2} = re^{j0} = \left(t^2+2\right)\hat{\mathbf{i}}_2$$

$$\mathbf{R}_{P_3/2}(1) = 3\hat{\mathbf{i}}_2$$

$$\mathbf{R}_{P_3/2}(2) = 6\hat{\mathbf{i}}_2$$

$$\Delta\mathbf{R}_{P_3/2} = \mathbf{R}_{P_3/2}(2) - \mathbf{R}_{P_3/2}(1) = 3\hat{\mathbf{i}}_2 \quad \underline{Ans.}$$

2.10 A wheel with center at O rolls without slipping on the ground at point P. If point O is displaced 10 in to the right, determine the displacement of point P during this interval.

Since the wheel rolls without slipping,

$$\Delta R_O = -\Delta\theta R_{PO}.$$

$$\Delta\theta = -\Delta R_O / R_{PO}$$

$$= -10 \text{ in} / 6 \text{ in} = -1.667 \text{ rad} = -95.51°$$

$$\theta' = \theta + \Delta\theta = 270° - 95.51° = 174.49°$$

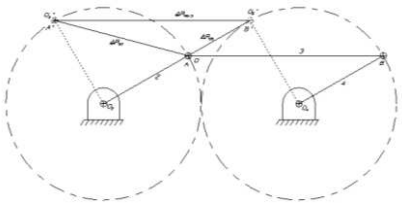

$$\mathbf{R}'_{PO} = 6 \text{ in}\angle 174.49° = -5.972\hat{\mathbf{i}} + 0.576\hat{\mathbf{j}} \text{ in}$$

$$\Delta\mathbf{R}_P = \Delta\mathbf{R}_O + \left(\mathbf{R}'_{PO} - \mathbf{R}_{PO}\right)$$

$$= 10\hat{\mathbf{i}} - 5.972\hat{\mathbf{i}} + 0.576\hat{\mathbf{j}} + 6\hat{\mathbf{j}} \text{ in}$$

$$\Delta\mathbf{R}_P = 4.028\hat{\mathbf{i}} + 6.576\hat{\mathbf{j}} = 7.712 \text{ in}\angle 58.51° \quad \underline{Ans.}$$

2.11 A point Q moves from A to B along link 3 while link 2 rotates from $\theta_2 = 30°$ to $\theta'_2 = 120°$ Find the absolute displacement of Q.

$R_{AO_2} = R_{BO_4} = 3$ in and $R_{BA} = R_{O_4O_2} = 6$ in

$$\mathbf{R}_{Q_3} = 3 \text{ in}\angle 30° = 2.598\hat{\mathbf{i}} + 1.500\hat{\mathbf{j}} \text{ in}$$

$$\mathbf{R}'_{Q_3} = 3 \text{ in}\angle 120° = -1.500\hat{\mathbf{i}} + 2.598\hat{\mathbf{j}} \text{ in}$$

$$\Delta\mathbf{R}_{Q_3} = \mathbf{R}'_{Q_3} - \mathbf{R}_{Q_3} = -4.098\hat{\mathbf{i}} + 1.098\hat{\mathbf{j}} \text{ in}$$

$$\Delta\mathbf{R}_{Q_5/3} = \mathbf{R}_{BA} = 6.000\hat{\mathbf{i}} \text{ in}$$

$$\Delta\mathbf{R}_{Q_5} = \Delta\mathbf{R}_{Q_3} + \Delta\mathbf{R}_{Q_5/3}$$

$$\Delta\mathbf{R}_{Q_5} = 1.902\hat{\mathbf{i}} + 1.098\hat{\mathbf{j}} \text{ in} = 2.196 \text{ in}\angle 30° \quad \underline{Ans.}$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

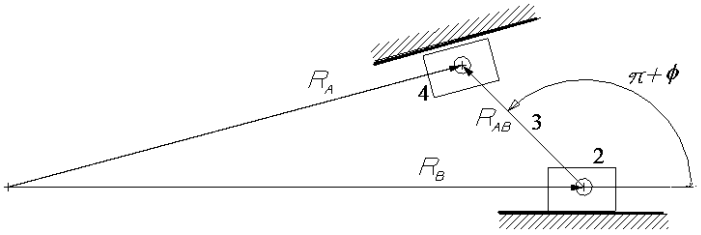

2.12 The double-slider linkage is driven by moving sliding block 2. Write the loop-closure equation. Solve analytically for the position of sliding block 4. Check the result graphically for the posture where $\phi = -45°$..

The loop-closure equation is

$$\overset{?\surd}{\mathbf{R}}_A = \overset{I\surd}{\mathbf{R}}_B + \overset{\surd ?}{\mathbf{R}}_{AB} \qquad \underline{Ans.}$$

$$R_A e^{j\pi/12} = R_B + R_{AB} e^{j(\pi+\phi)}$$

$$= R_B - R_{AB} e^{j\phi}$$

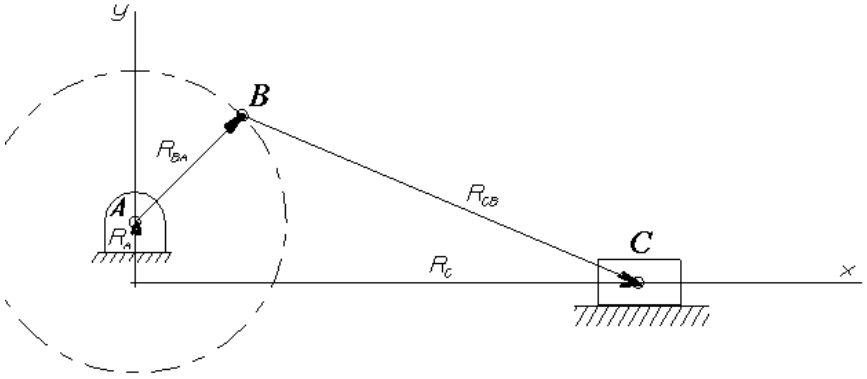

Taking the imaginary components of this, we get $R_{AB} = 200$ mm and $\psi = 15°$

$$R_A \sin 15° = -R_{AB} \sin\phi$$

$$R_A = -R_{AB}\frac{\sin\phi}{\sin 15°} = -200 \text{ mm}\frac{\sin -45°}{\sin 15°} = 546.4 \text{ mm} \qquad \underline{Ans.}$$

2.13 The offset slider-crank linkage is driven by crank 2. Write the loop-closure equation. Solve for the position of slider 4 as a function of θ_2.

$R_{AO} = 1$ in, $R_{BA} = 2.5$ in, and $R_{CB} = 7$ in.

$$\overset{?\surd}{\mathbf{R}}_C = \overset{\surd\surd}{\mathbf{R}}_A + \overset{\surd I}{\mathbf{R}}_{BA} + \overset{\surd ?}{\mathbf{R}}_{CB}$$

$$R_C = R_A e^{j\pi/2} + R_{BA} e^{j\theta_2} + R_{CB} e^{j\theta_3}$$

Taking real and imaginary parts,

$$R_C = R_{BA}\cos\theta_2 + R_{CB}\cos\theta_3 \quad \text{and} \quad 0 = R_A + R_{BA}\sin\theta_2 + R_{CB}\sin\theta_3$$

and, solving simultaneously, we get

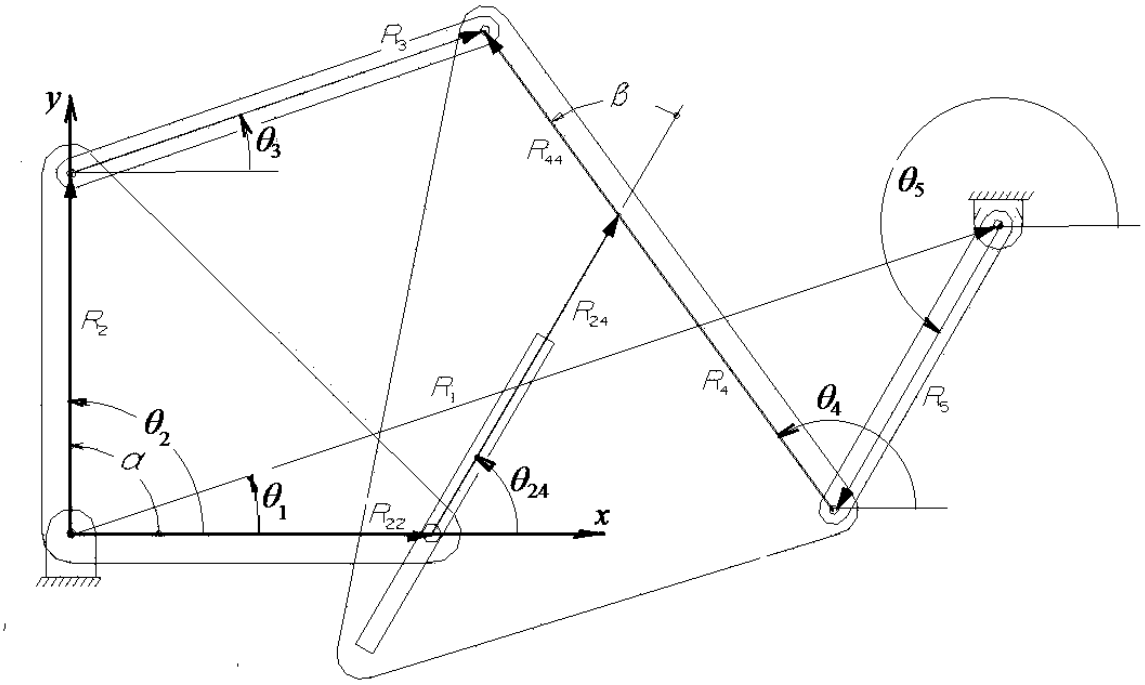

$$\theta_3 = \sin^{-1}\left(\frac{-R_A - R_{BA}\sin\theta_2}{R_{CB}}\right) \text{with } -90° < \theta_3 < 90°$$

$$R_C = R_{BA}\cos\theta_2 + \sqrt{R_{CB}^2 - \left(R_A + R_{BA}\sin\theta_2\right)^2}$$

$$= 2.5\cos\theta_2 + \sqrt{48 - 5\sin\theta_2 - 6.25\sin^2\theta_2} \text{ in} \qquad \underline{Ans.}$$

2.18 For the mechanism in Figure P1.6, define a set of vectors that is suitable for a complete kinematic analysis of the mechanism. Label and show the sense and orientation of each vector. Write the vector loop equation(s) for the mechanism. Identify suitable input(s), known quantities, unknown variables, and any constraints. If you identify constraints then write the constraint equation(s).

One set of vectors suitable for a kinematic analysis of the mechanism is shown below.

The corresponding vector loop equations are

$$\overset{\sqrt{\sqrt{}}}{\mathbf{R}_1}+\overset{\sqrt{I}}{\mathbf{R}_2}-\overset{\sqrt{?}}{\mathbf{R}_3}-\overset{?\sqrt{}}{\mathbf{R}_{13a}}=\mathbf{0} \quad \text{and} \quad \overset{\sqrt{?}}{\mathbf{R}_3}+\overset{\sqrt{?}}{\mathbf{R}_4}-\overset{?\sqrt{}}{\mathbf{R}_{15}}-\overset{C1C2}{\mathbf{R}_{13b}}=\mathbf{0} \qquad \textit{Ans.}$$

with the constraint equation(s) $R_{13a}+R_{13b}=\text{constant}$. (C1) and $\theta_{13b}=\theta_{13a}$ (C2). *Ans.*

Angle θ_2 is a suitable input. *Ans.*

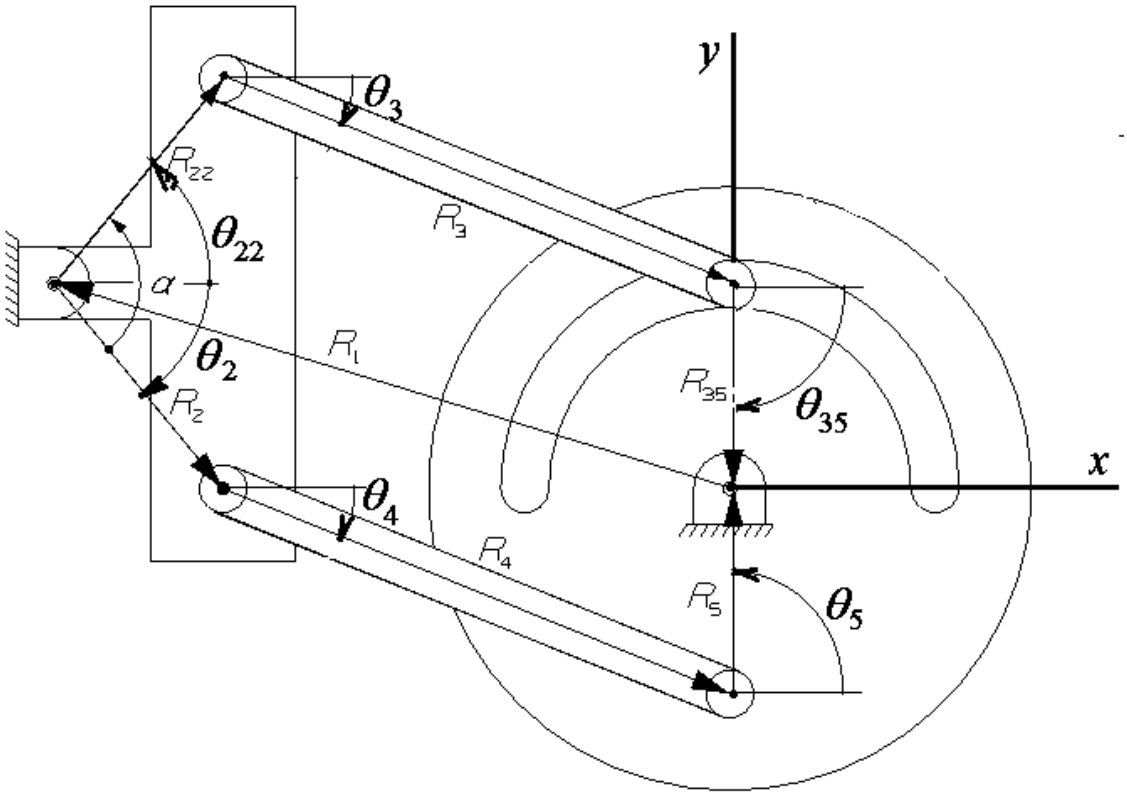

Known quantities are R_1, θ_1=90°, R_2, R_3, θ_{13a}, R_4, and θ_{15}=0. *Ans.*

Unknown variables are θ_3, R_{13a}, R_{13b}, θ_{13b}, θ_4, and R_{15}. *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

2.19 For the mechanism in Figure P1.8, define a set of vectors that is suitable for a complete kinematic analysis of the mechanism. Label and show the sense and orientation of each vector. Write the vector loop equation(s) for the mechanism. Identify suitable input(s), known quantities, unknown variables, and any constraints. If you identify constraints then write the constraint equation(s).

One set of vectors suitable for a kinematic analysis of the mechanism is shown here.

The corresponding set of vector loop equations is

$$\overset{\sqrt{\sqrt{}}}{\mathbf{R}_1}+\overset{\sqrt{?}}{\mathbf{R}_2}+\overset{\sqrt{?}}{\mathbf{R}_4}+\overset{\sqrt{I}}{\mathbf{R}_5}=\mathbf{0} \quad \text{and} \quad \overset{\sqrt{\sqrt{}}}{\mathbf{R}_1}+\overset{\sqrt{C1}}{\mathbf{R}_{22}}+\overset{\sqrt{?}}{\mathbf{R}_3}+\overset{\sqrt{?}}{\mathbf{R}_{35}}=\mathbf{0} \qquad \underline{Ans.}$$

with the constraint equation $\theta_{22}=\theta_2+\alpha$ (C1). *Ans.*

Angle θ_5 is a suitable input. *Ans.*

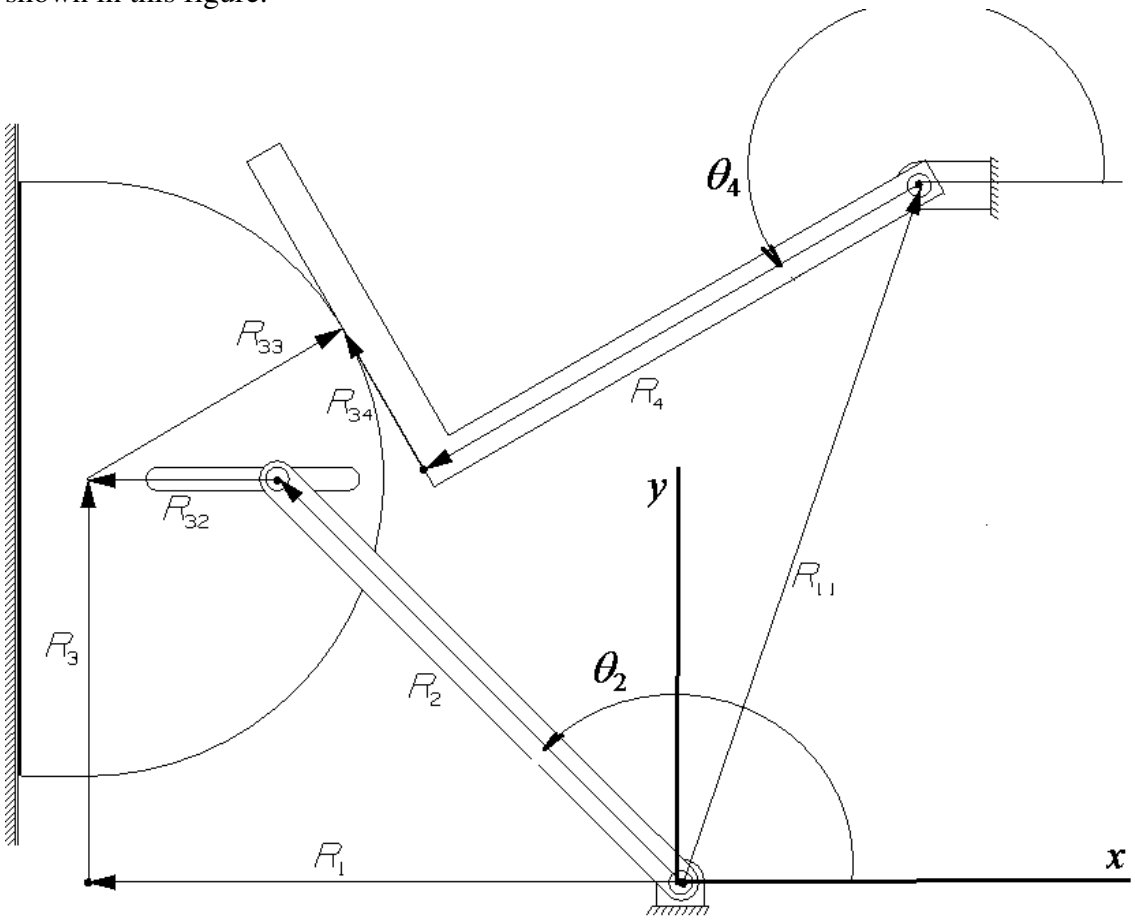

Known quantities are R_1, θ_1, R_2, R_3, R_4, R_5, R_{22}, and R_{35}. *Ans.*

Unknown variables are θ_2, θ_3, θ_4, θ_{22}, and θ_{35}. *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

2.20 For the mechanism in Figure P1.9, define a set of vectors that is suitable for a complete kinematic analysis of the mechanism. Label and show the sense and orientation of each vector. Write the vector loop equation(s) for the mechanism. Identify suitable input(s), known quantities, unknown variables, and any constraints. If you identify constraints then write the constraint equation(s).

One set of vectors suitable for a complete kinematic analysis of this mechanism is as shown in this figure.

The corresponding set of vector loop equations is

$$\overset{\surd\surd}{\mathbf{R}}_1+\overset{?\surd}{\mathbf{R}}_3-\overset{?\surd}{\mathbf{R}}_{32}-\overset{\surd I}{\mathbf{R}}_2=\mathbf{0} \quad \text{and} \quad \overset{\surd\surd}{\mathbf{R}}_{11}+\overset{\surd?}{\mathbf{R}}_4+\overset{?C1}{\mathbf{R}}_{34}-\overset{\surd C2}{\mathbf{R}}_{33}-\overset{?\surd}{\mathbf{R}}_{32}-\overset{\surd I}{\mathbf{R}}_2=\mathbf{0} \qquad \underline{Ans.}$$

with the two constraint equations

$$\theta_{34}=\theta_4-90^\circ \quad (C1) \qquad \text{and} \qquad \theta_{33}=\theta_4-180^\circ \quad (C2). \qquad \underline{Ans.}$$

The angle θ_2 is a suitable input. *Ans.*

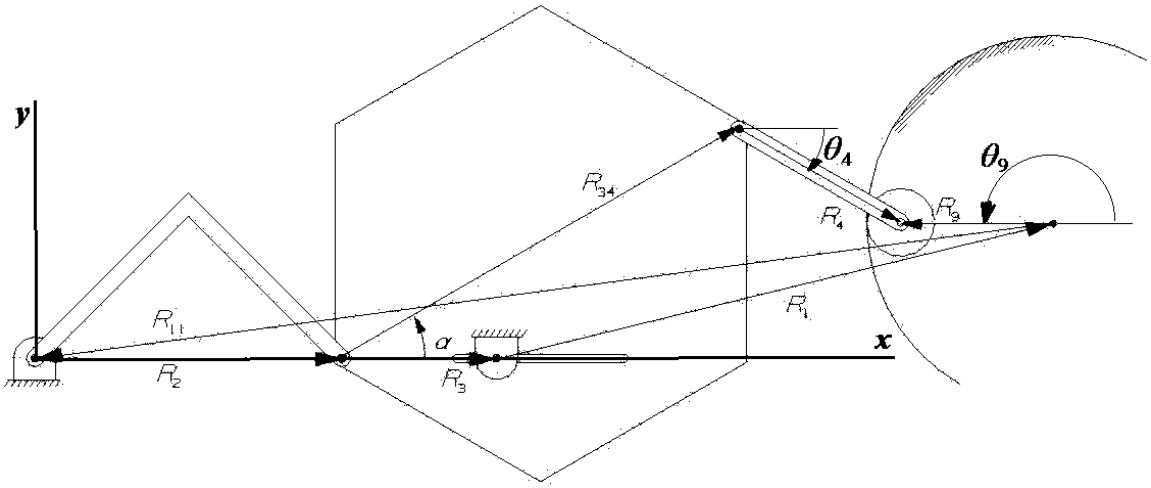

Known quantities are R_1, θ_1=180°, R_2, θ_3=90°, R_4, R_{11}, θ_{11}, θ_{32}=180°, and R_{33}. *Ans.*

Unknown variables are R_3, θ_4, R_{32}, θ_{33}, R_{34}, and θ_{34}. *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

2.21 For the mechanism in Figure P1.10, define a set of vectors that is suitable for a complete kinematic analysis of the mechanism. Label and show the sense and orientation of each vector. Write the vector loop equation(s) for the mechanism. Identify suitable input(s), known quantities, unknown variables, and any constraints. If you identify constraints then write the constraint equation(s).

One set of vectors suitable for a kinematic analysis of the mechanism is shown here.

The corresponding set of vector loop equations is

$$\overset{\surd\surd}{\mathbf{R}}_1+\overset{\surd\surd}{\mathbf{R}}_{11}+\overset{\surd I}{\mathbf{R}}_2+\overset{??}{\mathbf{R}}_3=\mathbf{0} \quad \text{and} \quad \overset{\surd\surd}{\mathbf{R}}_{11}+\overset{\surd I}{\mathbf{R}}_2+\overset{\surd C1}{\mathbf{R}}_{34}+\overset{\surd ?}{\mathbf{R}}_4-\overset{\surd ?}{\mathbf{R}}_9=\mathbf{0} \qquad \underline{Ans.}$$

with the constraint equation $\theta_{34}=\theta_3+\alpha$. $(C1)$ <u>Ans.</u>

Angle θ_2 is a suitable input. <u>Ans.</u>

The known quantities are R_1, θ_1, R_2, R_4, R_9, R_{11}, θ_{11}, and R_{34}. <u>Ans.</u>

The unknown variables are R_3, θ_3, θ_4, θ_9, and θ_{34}.

However, these equations do not analyze the angular displacement of the small wheel, body 5. In order to do this, we might consider the apparent angular displacement as seen by an observer fixed on vector 9 and viewing the point of contact between bodies 5 and 1. The non-slip condition would provide the constraint

$$\rho_1\Delta\theta_{1/9}=\rho_5\Delta\theta_{5/9} \quad \text{(C2)}$$

$$\rho_1\left(\Delta\cancel{\theta_1}-\Delta\theta_9\right)=\rho_5\left(\Delta\theta_5-\Delta\theta_9\right)$$

$$\rho_5\Delta\theta_5+\left(\rho_1-\rho_5\right)\Delta\theta_9=0$$

$$\rho_5\Delta\theta_5+R_9\Delta\theta_9=0 \qquad \underline{Ans.}$$

where ρ_5 is the radius of wheel 5 and $\Delta\theta_5$ is the angular displacement of body 5.

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

2.22 Write a calculator program to find the sum of any number of two-dimensional vectors expressed in mixed rectangular or polar forms. The result should be obtainable in either form with the magnitude and angle of the polar form having only positive values.

Because the variety of makes and models of calculators is vast and no standards are known for programming them, no solution is shown here.

2.23 Write a computer program to plot the coupler curve of any crank-rocker or double-crank form of the four-bar linkage. The program should accept four link lengths and either rectangular or polar coordinates of the coupler point with respect to the coupler.

Again the variety of programming languages makes it impossible to provide a standard solution. However, one version, written in ANSI/ISO FORTRAN 77, is supplied here as an example. There are also no universally accepted standards for programming graphics. Therefore the Tektronix PLOT10 subroutine library, for display on Tektronix 4010 series displays, is chosen as an old but somewhat recognized alternative. The symbols in the program correspond to the notation shown in Fig. 2.15 of the text. The required input data are:

$$\text{R1, R2, R3, R4,} \begin{cases} \text{X5,Y5,} & -1 \\ \text{R5,ALPHA,} & 1 \end{cases}$$

The program can be verified using the data of Example 2.6 and checking the results against those of Table 2.3.

2.24 Plot the path of point *P* for: (*a*) inverted slider-crank linkage; (*b*) second inversion of the slider-crank linkage; (*c*) Scott-Russell straight-line linkage; and (*d*) drag-link linkage.

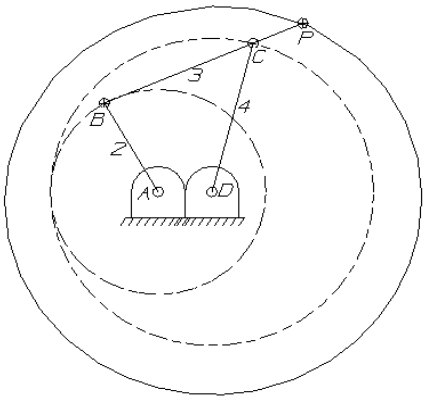

(*a*)

(*b*)

(*c*)

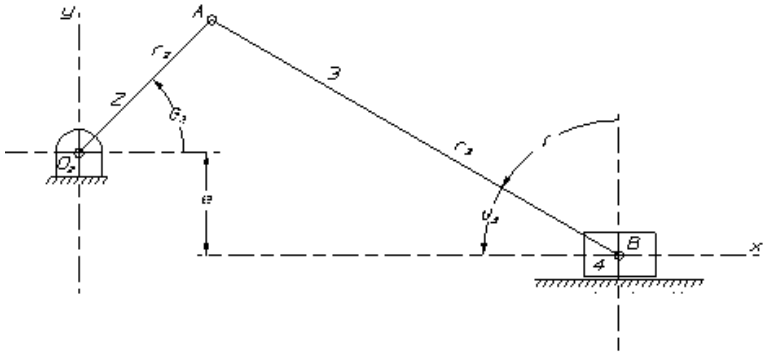

(*d*)

(*a*) $R_{CA} = 2$ in, $R_{BA} = 3.5$ in, and $R_{PC} = 4$ in; (*b*) $R_{CA} = 40$ mm, $R_{BA} = 20$ mm, and $R_{PB} = 65$ mm; (*c*) $R_{BA} = R_{CB} = R_{PB} = 25$ mm; (*d*) $R_{DA} = 1$ in, $R_{BA} = 2$ in, $R_{CB} = R_{CD} = 3$ in, and $R_{PB} = 4$ in.

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

2.25 Using the offset slider-crank linkage in Figure P2.13, find the crank angles corresponding to the extreme values of the transmission angle.

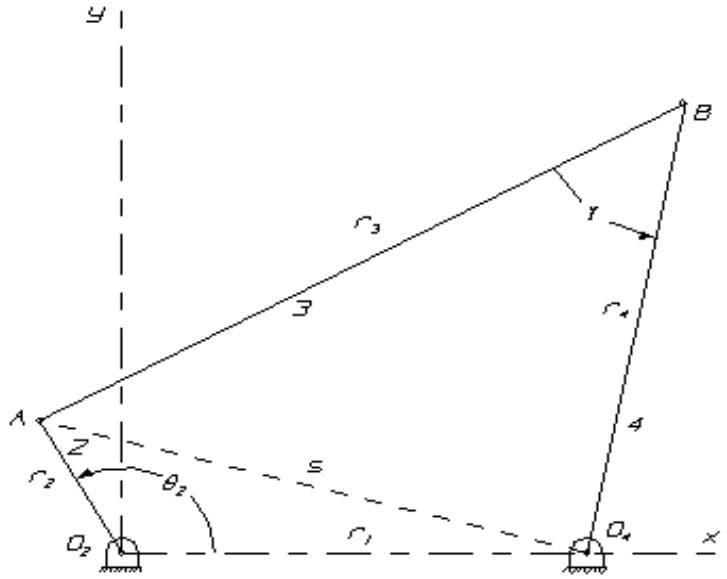

As shown, $\gamma = 90° - \theta_3$.
Also from the figure
$e + r_2 \sin\theta_2 = r_3 \cos\gamma$.
Differentiating with respect to θ_2;

$$r_2 \cos\theta_2 = -r_3 \sin\gamma \frac{d\gamma}{d\theta_2};$$

$$\frac{d\gamma}{d\theta_2} = -\frac{r_2 \cos\theta_2}{r_3 \sin\gamma}.$$

Now, setting $d\gamma / d\theta_2 = 0$, we get $\cos\theta_2 = 0$.
Therefore, we conclude that $\theta_2 = \pm(2k+1)\pi/2 = \pm 90°, \pm 270°, \ldots$ *Ans.*

2.26 Section 1.10 states that the transmission angle reaches an extreme value for the four-bar linkage when the crank lies on the line between the fixed pivots. Referring to Figure 2.19, this means that γ reaches a maximum or minimum when crank 2 is collinear with the line O_2O_4. Show, analytically, that this statement is true.

From ΔO_4O_2A:
$s^2 = r_1^2 + r_2^2 - 2r_1r_2\cos\theta_2$.
Also, from ΔABO_4:
$s^2 = r_3^2 + r_4^2 - 2r_3r_4\cos\gamma$.
Equating these we differentiate with respect to θ_2 to obtain

$$2r_1r_2\sin\theta_2 = 2r_3r_4\sin\gamma\frac{d\gamma}{d\theta_2} \text{ or}$$

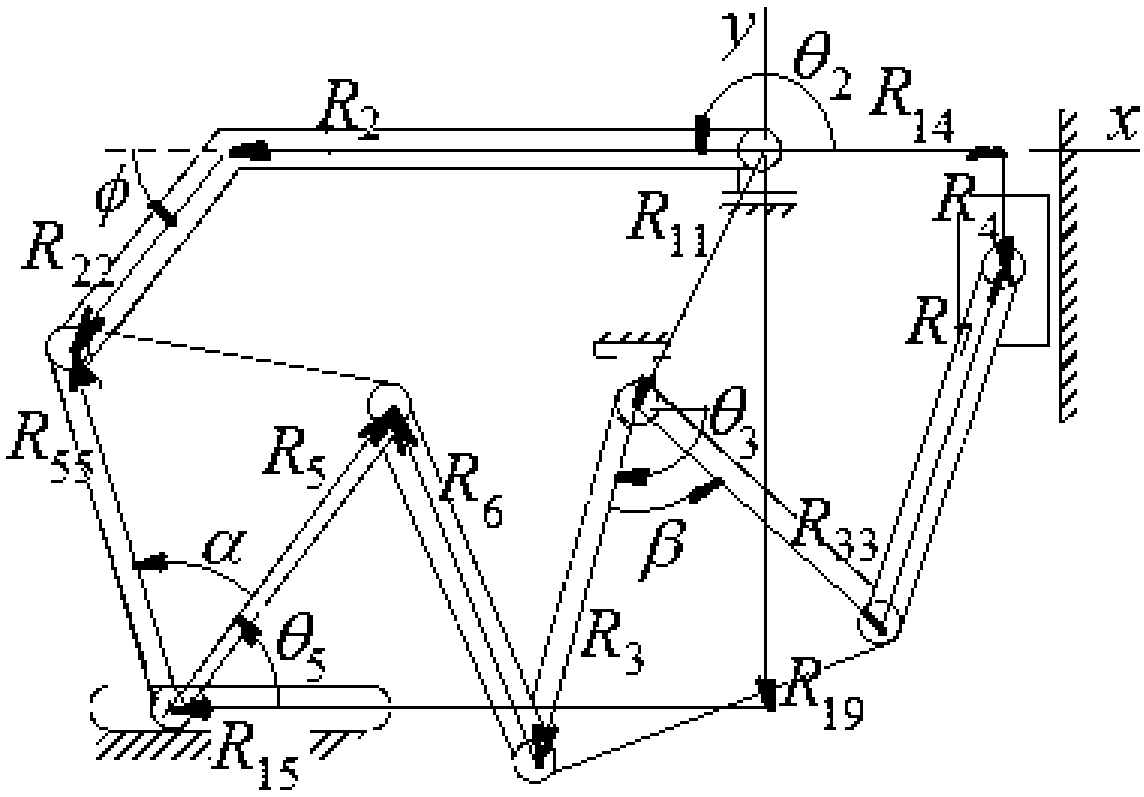

$$\frac{d\gamma}{d\theta_2} = \frac{r_1r_2\sin\theta_2}{r_3r_4\sin\gamma}.$$

Now, for $\frac{d\gamma}{d\theta_2} = 0$, we have $\sin\theta_2 = 0$. Thus, $\theta_2 = 0,\ \pm 180°,\ \pm 360°, \ldots$ *Q.E.D.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

2.27 Define a set of vectors that is suitable for a complete kinematic analysis of the mechanism. Label and show the sense and orientation of each vector. Write the vector loop equation(s) for the mechanism. Identify suitable input(s), known quantities, unknown variables, and any constraints. If you identify constraints then write the constraint equation(s).

One set of vectors suitable for a kinematic analysis of the mechanism is shown here.

The three vector loop equations are

$$\overset{\surd\surd}{\mathbf{R}}_{11}+\overset{\surd?}{\mathbf{R}}_{3}+\overset{\surd?}{\mathbf{R}}_{6}-\overset{\surd?}{\mathbf{R}}_{5}-\overset{?\surd}{\mathbf{R}}_{15}-\overset{\surd\surd}{\mathbf{R}}_{19}=\mathbf{0}$$

$$\overset{\surd I}{\mathbf{R}}_{2}+\overset{\surd C1}{\mathbf{R}}_{22}-\overset{\surd C3}{\mathbf{R}}_{55}-\overset{?\surd}{\mathbf{R}}_{15}-\overset{\surd\surd}{\mathbf{R}}_{19}=\mathbf{0}$$

$$\overset{\surd\surd}{\mathbf{R}}_{11}+\overset{\surd C2}{\mathbf{R}}_{33}+\overset{\surd?}{\mathbf{R}}_{7}-\overset{?\surd}{\mathbf{R}}_{4}-\overset{\surd\surd}{\mathbf{R}}_{14}=\mathbf{0}$$ *Ans.*

with three constraint equations

$\theta_{22}=\theta_2+\phi$ $(C1)$ $\theta_{33}=\theta_3+\beta$ $(C2)$ and $\theta_{55}=\theta_5+\alpha$ $(C3)$. *Ans.*

The angle θ_2 is a suitable input. *Ans.*

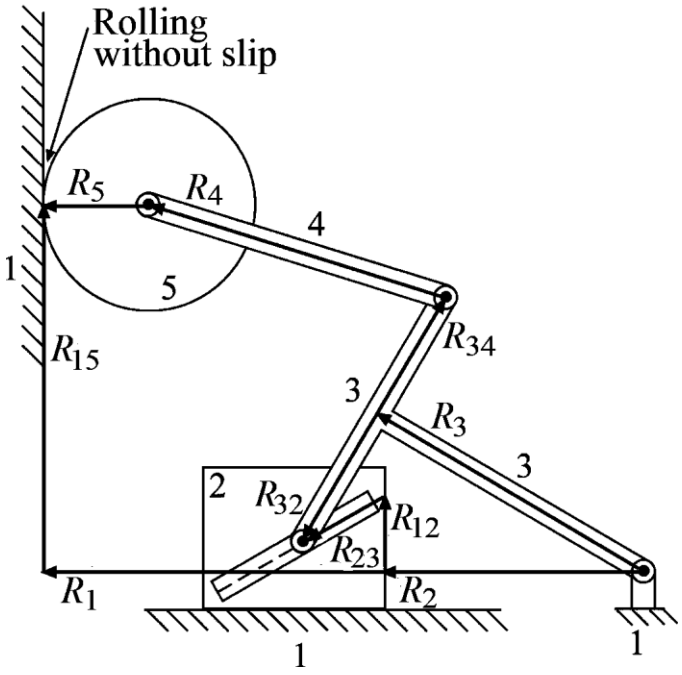

Known quantities are: R_2, R_3, θ_4=–90°, R_5, R_6, R_7, R_{11}, θ_{11}, R_{14}, θ_{14}=0, θ_{15}=180°, R_{19}, θ_{19}=–90°, R_{22}, R_{33}, and R_{55} *Ans.*

Unknown variables are θ_3, R_4, θ_5, θ_6, θ_7, R_{15}, θ_{22}, θ_{33}, and θ_{55}. *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

2.28 Define a set of vectors that is suitable for a complete kinematic analysis of the mechanism. Label and show the sense and orientation of each vector. Write the vector loop equation(s) for the mechanism. Identify suitable input(s), known quantities, unknown variables, and any constraints. If you identify constraints then write the constraint equation(s).

One set of vectors suitable for a kinematic analysis of the mechanism is shown here.

The two vector loop equations are

$$\overset{1\surd}{\mathbf{R}}_2+\overset{\surd\surd}{\mathbf{R}}_{12}+\overset{?\surd}{\mathbf{R}}_{23}-\overset{\surd C1}{\mathbf{R}}_{32}-\overset{\surd?}{\mathbf{R}}_3=\mathbf{0}$$

$$\overset{\surd?}{\mathbf{R}}_3+\overset{\surd C2}{\mathbf{R}}_{34}+\overset{\surd?}{\mathbf{R}}_4+\overset{\surd\surd}{\mathbf{R}}_5-\overset{?\surd}{\mathbf{R}}_{15}-\overset{\surd\surd}{\mathbf{R}}_1=\mathbf{0} \qquad \underline{\textit{Ans.}}$$

with two constraint equations

$$\theta_{32}=\theta_3+90^\circ \quad (C1) \qquad \text{and} \qquad \theta_{34}=\theta_3-90^\circ \quad (C2). \qquad \underline{\textit{Ans.}}$$

The magnitude R_2 is a suitable input. $\underline{\textit{Ans.}}$

Known quantities are: R_1, θ_1=180°, θ_2=180°, R_3, R_4, R_5, θ_5=180°, R_{12}, θ_{12}=90°, θ_{15}=90°, θ_{23}, R_{32}, and R_{34}. $\underline{\textit{Ans.}}$

Unknown variables are θ_3, θ_4, R_{15}, R_{23}, θ_{32}, and θ_{34}. $\underline{\textit{Ans.}}$

Note that the angular displacement of the wheel 5 is related to the distance R_{15} by rolling contact. The rolling contact equation between link 5 and the ground link 1 can be written as

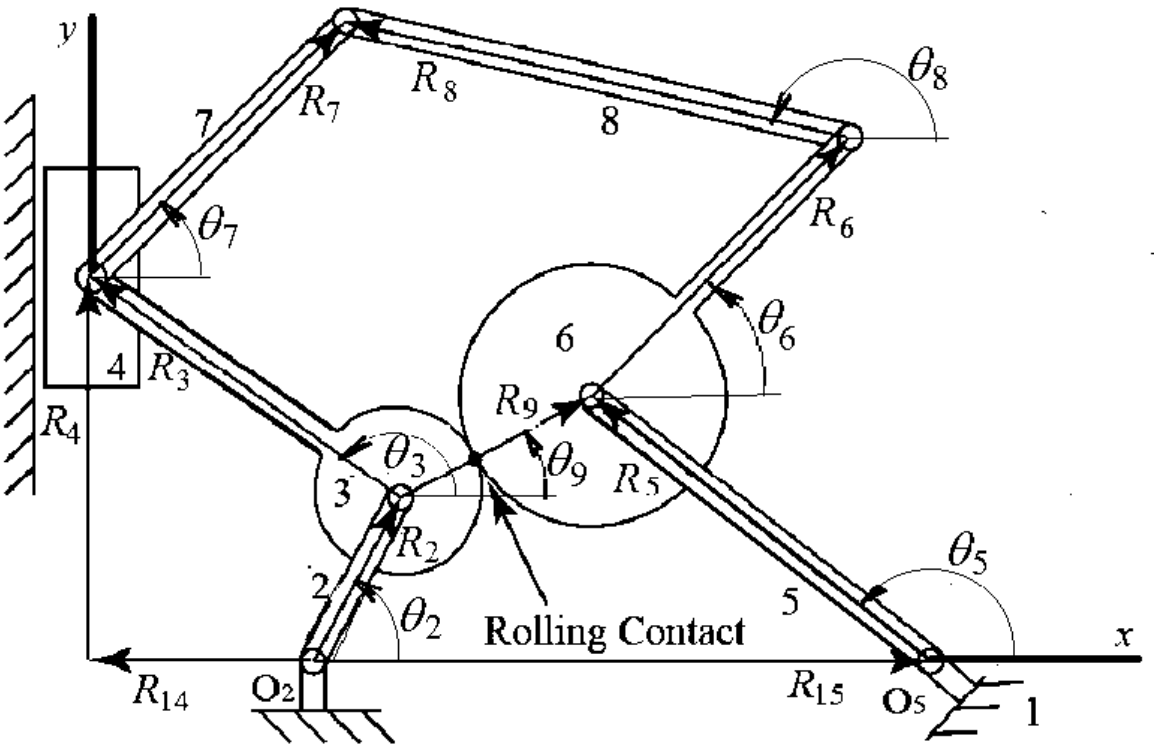

$$\pm\Delta R_{15}=\rho_5\left(\Delta\theta_5-\Delta\theta_{15}\right)=\rho_5\,\Delta\theta_5$$

The correct sign in this equation is positive because, for a positive (counterclockwise) rotation of wheel 5, the length of the vector R_{15} is increasing whereas, for a negative (clockwise) rotation of wheel 5, the length of the vector R_{15} is decreasing.

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

2.29 Define a set of vectors that is suitable for a complete kinematic analysis of the mechanism. Label and show the sense and orientation of each vector. Write the vector loop equation(s) for the mechanism. Identify suitable input(s), known quantities, unknown variables, and any constraints. If you identify constraint(s) then write the constraint equation(s).

One set of vectors suitable for a kinematic analysis of the mechanism is shown here.

The three vector loop equations are

$$\mathbf{R}_2 + \mathbf{R}_3 - \mathbf{R}_4 - \mathbf{R}_{14} = \mathbf{0}$$

$$\mathbf{R}_2 + \mathbf{R}_9 - \mathbf{R}_5 - \mathbf{R}_{15} = \mathbf{0}$$

$$\mathbf{R}_3 + \mathbf{R}_7 - \mathbf{R}_8 - \mathbf{R}_6 - \mathbf{R}_9 = \mathbf{0} \qquad \textit{Ans.}$$

with one constraint equation

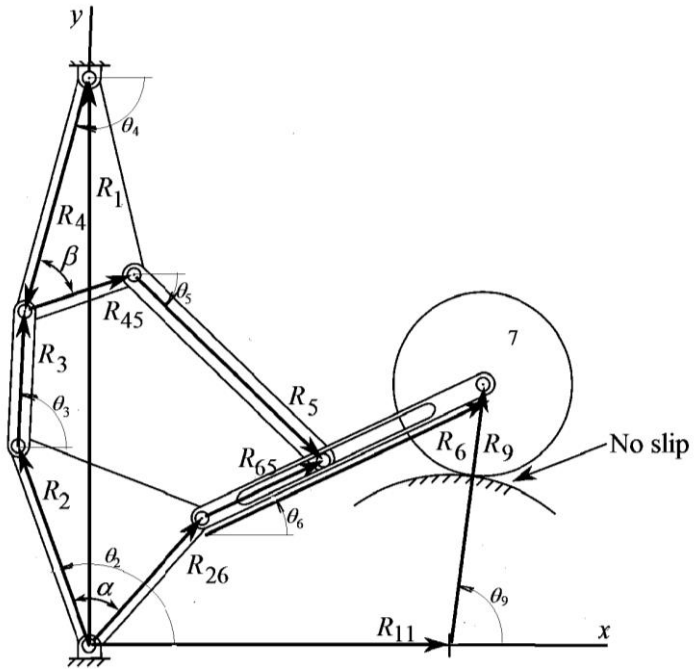

$$-\frac{\rho_6}{\rho_3} = \frac{\Delta\theta_3 - \Delta\theta_9}{\Delta\theta_6 - \Delta\theta_9} \qquad \textit{Ans.}$$

where the minus sign is used because gears 3 and 6 have external rolling contact.
The angle θ_2 is a suitable input. *Ans.*
Known quantities are:
R_2, R_3, θ_4=90°, R_5, R_6, R_7,R_8, R_9=ρ_6+ρ_3, R_{14}, θ_{14}=180°, R_{15}, and θ_{15}=0. *Ans.*
Unknown variables are θ_3, R_4, θ_5, θ_6, θ_7, θ_8, and θ_9. *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

2.30 Define a set of vectors that is suitable for a complete kinematic analysis of the mechanism. Label and show the sense and orientation of each vector.. Write the vector loop equation(s) for the mechanism. Identify suitable input(s), known quantities, unknown variables, and any constraints. If you identify constraint(s) then write the constraint equation(s).

One set of vectors suitable for a kinematic analysis of the mechanism is shown here.

The three vector loop equations are

$$\overset{\sqrt{I}}{\mathbf{R}}_2 + \overset{\sqrt{?}}{\mathbf{R}}_3 - \overset{\sqrt{?}}{\mathbf{R}}_4 - \overset{\sqrt{\sqrt{}}}{\mathbf{R}}_1 = \mathbf{0}$$

$$\overset{\sqrt{C1}}{\mathbf{R}}_{26} + \overset{\sqrt{?}}{\mathbf{R}}_6 - \overset{\sqrt{?}}{\mathbf{R}}_9 - \overset{\sqrt{\sqrt{}}}{\mathbf{R}}_{11} = \mathbf{0}$$

$$\overset{\sqrt{I}}{\mathbf{R}}_2 + \overset{\sqrt{?}}{\mathbf{R}}_3 + \overset{\sqrt{C2}}{\mathbf{R}}_{45} + \overset{\sqrt{?}}{\mathbf{R}}_5 - \overset{?C3}{\mathbf{R}}_{65} - \overset{\sqrt{C1}}{\mathbf{R}}_{26} = \mathbf{0} \qquad \underline{\textit{Ans.}}$$

There are four constraint equations

$$\theta_{26} = \theta_2 - \alpha \ \text{(C1)}$$

$$\theta_{45} = \theta_4 - \beta + 180^\circ \ \text{(C2)}$$

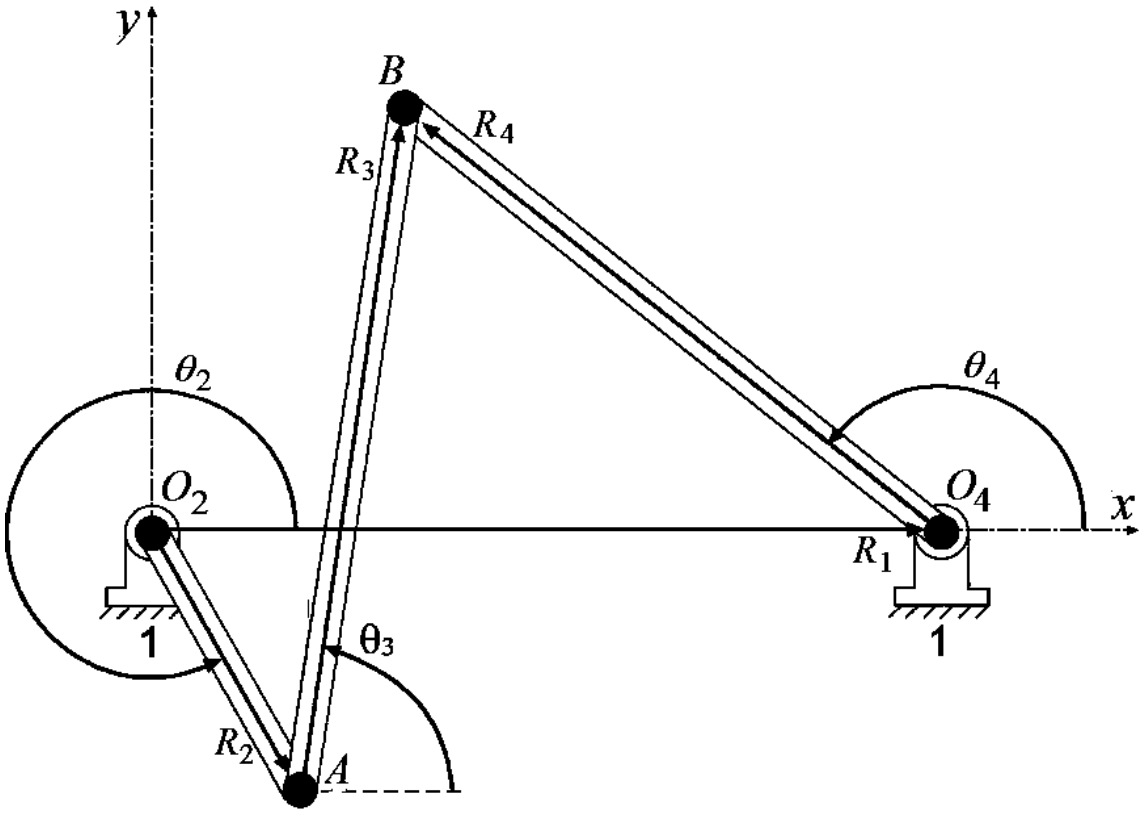

$$\theta_{65} = \theta_6 \quad \text{(C3)}$$

$$-\frac{\rho_1}{\rho_7} = \frac{\Delta\theta_7 - \Delta\theta_9}{\Delta\theta_1 - \Delta\theta_9} \ \text{(C4)} \qquad \underline{\textit{Ans.}}$$

where the minus sign is used because gears 1 and 7 have external rolling contact.
The angle θ_2 is a suitable input. <u>*Ans.*</u>
Known quantities are: R_1, θ_1=90°, R_2, R_3, R_4, R_5, R_6, R_9, R_{11}, θ_{11}=0, R_{26}, and R_{45}. <u>*Ans.*</u>
Unknown variables are θ_3, θ_4, θ_5, θ_6, θ_7, θ_9, θ_{26}, θ_{45}, R_{65}, and θ_{65}. <u>*Ans.*</u>

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

2.31 For the input angle $\theta_2 = 300^o$, measured counterclockwise from the *x*-axis, determine the two postures of link 4.

$r_2 = 60$ mm, $r_3 = 140$ mm, $r_4 = 140$ mm, and $r_1 = 160$ mm.

The vector loop equation can be written

$$\mathbf{r}_2 + \mathbf{r}_3 - \mathbf{r}_4 - \mathbf{r}_1 = \mathbf{0}$$

The horizontal and vertical components are

$$r_2 \cos\theta_2 + r_3 \cos\theta_3 - r_4 \cos\theta_4 - r_1 = 0$$

$$r_2 \sin\theta_2 + r_3 \sin\theta_3 - r_4 \sin\theta_4 = 0$$

Squaring, adding, and rearranging these gives us Freudenstein's equation. That is

$$A\cos\theta_4 + B\sin\theta_4 = C \qquad (1)$$

where

$$A = 2r_1r_4 - 2r_2r_4\cos\theta_2$$

$$B = -2r_2r_4\sin\theta_2$$

$$C = r_3^2 - r_4^2 - r_1^2 - r_2^2 + 2r_1r_2\cos\theta_2$$

Substituting the known data into these equations gives

$$A = 2(160\text{ mm})(140\text{ mm}) - 2(60\text{ mm})(140\text{ mm})\cos 300° = 36\,400\ (\text{mm})^2$$

$$B = -2(60\text{ mm})(140\text{ mm})\sin 300° = 14\,549\ (\text{mm})^2$$

$$C = (140\text{ mm})^2 - (140\text{ mm})^2 - (160\text{ mm})^2 - (60\text{ mm})^2 + 2(160\text{ mm})(60\text{ mm})\cos 300°$$

$$= -19\,600\ (\text{mm})^2$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

which reduces Eq. (1) to the form

$$36\ 400\cos\theta_4 + 14\ 549\sin\theta_4 + 19\ 600 = 0 \qquad (2)$$

To solve this transcendental equation, we define

$$Z = \tan\left(\theta_4/2\right) \qquad (3)$$

which gives

$$\sin\theta_4 = \frac{2Z}{1+Z^2} \quad \text{and} \quad \cos\theta_4 = \frac{1-Z^2}{1+Z^2}$$

Substituting these into Eq. (2), and rearranging, gives

$$16\ 800Z^2 - 29\ 098Z - 56\ 000 = 0$$

which has the solutions

$$Z = \frac{14\ 549 \pm \sqrt{\left(14\ 549\right)^2 - \left(16\ 800\right)\left(-56\ 000\right)}}{16\ 800}$$

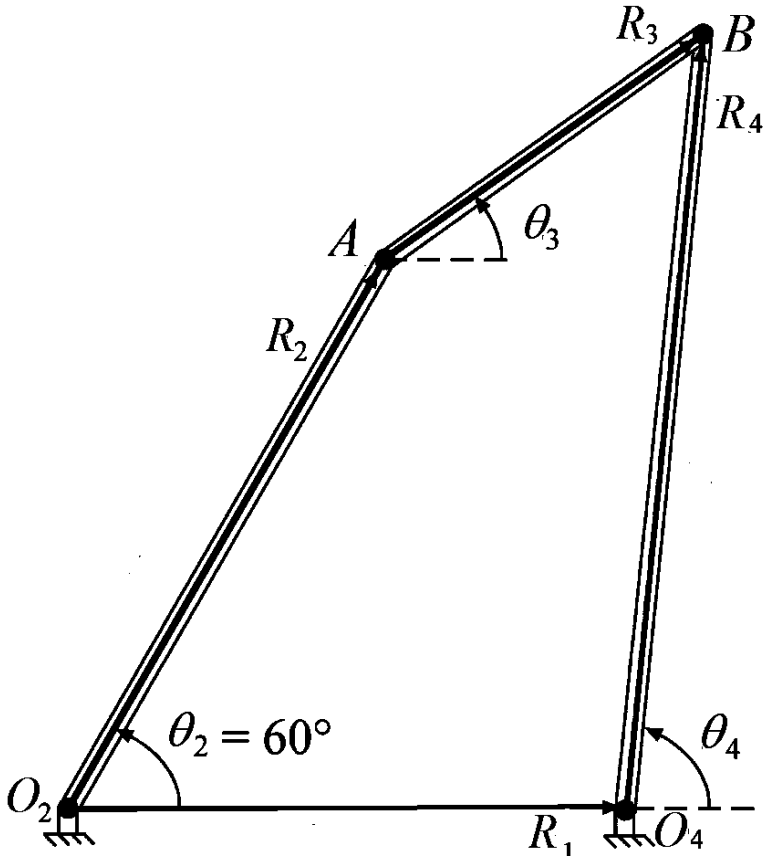

$$= 2.886\ 73 \quad \text{or} \quad -1.154\ 71$$

Substituting these two roots back into Eq. (3) gives the two solutions

$$\theta_4 = 141.79° \quad \text{and} \quad \theta_4 = -98.21° \qquad \textit{Ans.}$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

2.32 For the input angle $\theta_2 = 60^o$, measured counterclockwise from the x-axis, determine the two postures of link 4.

$r_2 = 80$ mm, $r_3 = 50$ mm, $r_4 = 100$ mm, and $r_1 = 70$ mm.

The vector loop equation can be written

$$\mathbf{r}_2 + \mathbf{r}_3 - \mathbf{r}_4 - \mathbf{r}_1 = \mathbf{0}$$

The horizontal and vertical components are

$$r_2 \cos\theta_2 + r_3 \cos\theta_3 - r_4 \cos\theta_4 - r_1 = 0$$

$$r_2 \sin\theta_2 + r_3 \sin\theta_3 - r_4 \sin\theta_4 = 0$$

Squaring, adding, and rearranging these gives us Freudenstein's equation. That is

$$A\cos\theta_4 + B\sin\theta_4 = C \qquad (1)$$

where

$$A = 2r_1r_4 - 2r_2r_4\cos\theta_2$$

$$B = -2r_2r_4\sin\theta_2$$

$$C = r_3^2 - r_4^2 - r_1^2 - r_2^2 + 2r_1r_2\cos\theta_2$$

Substituting the known data into these equations gives

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

$$A = 2(70\text{ mm})(100\text{ mm}) - 2(80\text{ mm})(100\text{ mm})\cos 60° = 6\ 000\ (\text{mm})^2$$

$$B = -2(80\text{ mm})(100\text{ mm})\sin 60° = -13\ 856.4\ (\text{mm})^2$$

$$C = (50\text{ mm})^2 - (100\text{ mm})^2 - (70\text{ mm})^2 - (80\text{ mm})^2 + 2(70\text{ mm})(80\text{ mm})\cos 60°$$

$$= -13\ 200\ (\text{mm})^2$$

which reduces Eq. (1) to the form

$$6\ 000\cos\theta_4 - 13\ 856\sin\theta_4 + 13\ 200 = 0 \qquad (2)$$

To solve this transcendental equation, we define

$$Z = \tan(\theta_4/2) \qquad (3)$$

which gives

$$\sin\theta_4 = \frac{2Z}{1+Z^2} \quad \text{and} \quad \cos\theta_4 = \frac{1-Z^2}{1+Z^2}$$

Substituting these into Eq. (2), and rearranging, gives

$$7\ 200Z^2 - 27\ 712Z + 19\ 200 = 0$$

which has the solutions

$$Z = \frac{13\ 856 \pm \sqrt{(-13\ 856)^2 - (7\ 200)(19\ 200)}}{7\ 200}$$

$$= 2.942\ 69 \quad \text{or} \quad 0.906\ 20$$

Substituting these two roots back into Eq. (3) gives the two solutions

$$\theta_4 = 142.46° \quad \text{and} \quad \theta_4 = 84.37°\ .$$

The angular position of link 4, for the open configuration shown is $\theta_4 = 84.37°$. *Ans.*

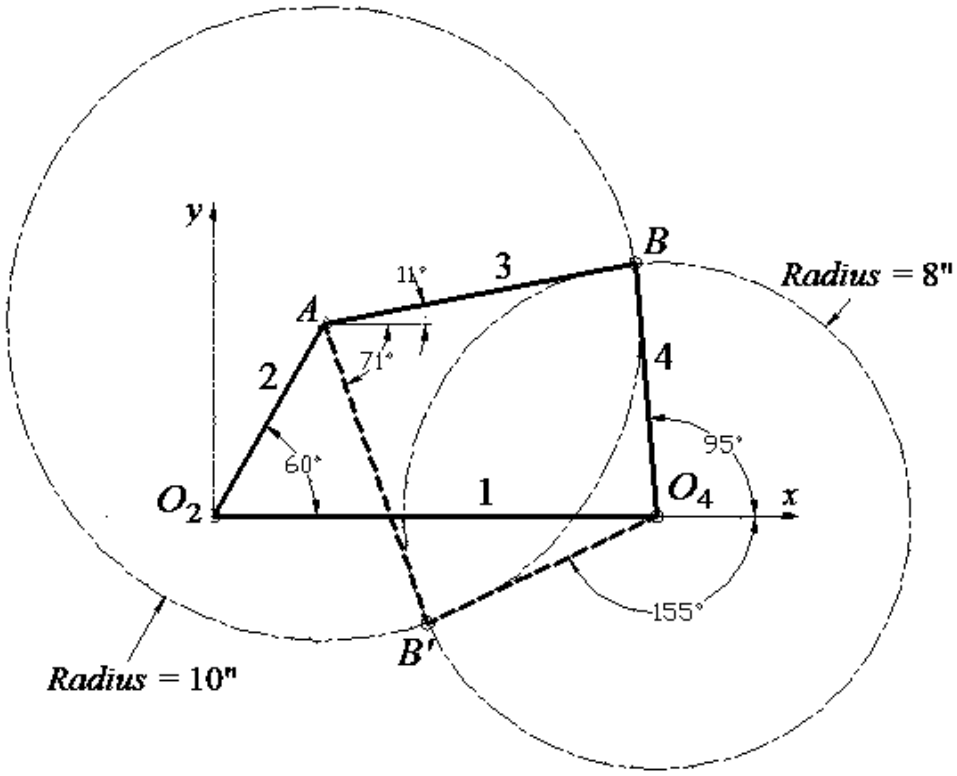

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

2.33 Consider a four-bar linkage for which ground link 1 is 14 in, input link 2 is 7 in, coupler link 3 is 10 in, and output link 4 is 8 in. The fixed x and y axes are specified as horizontal and vertical, respectively. The origin of this reference frame is coincident with the ground pivot of link 2, and the ground link is aligned with the x axis. For the input angle $\theta_2 = 60^\circ$ (counterclockwise from the x axis): (*a*) Using a suitable scale, draw the linkage in the open and crossed postures and measure the values of the variables θ_3 and θ_4 for each posture. (*b*) Use trigonometry (that is, the laws of sines and cosines) to determine θ_3 and θ_4 for the open posture. (*c*) Use Freudenstein's equation to determine θ_3 and θ_4 for both postures. (*d*) Use the Newton-Raphson iteration procedure to determine θ_3 and θ_4 for the open posture. Using the measurements in (*a*) as initial estimates for θ_3 and θ_4, iterate until the two variables converge to within 0.01°.

(*a*) Graphic Method. The link dimensions and angles are specified as:

Ground Link:	R_1 = 14.0 in	$\theta_1 = 0$
Input Link:	R_2 = 7.0 in	$\theta_2 = 60^\circ$
Coupler Link:	R_3 = 10.0 in	θ_3 = ?
Output Link:	R_4 = 8.0 in	θ_4 = ?

For the specified input angle $\theta_2 = 60^\circ$, the two possible configurations of the four-bar linkage are as shown in the following figure. The loop O_2ABO_4 is the open posture of the four-bar linkage and the loop $O_2AB'O_4$ is the closed (crossed) posture.

Graphic solution.

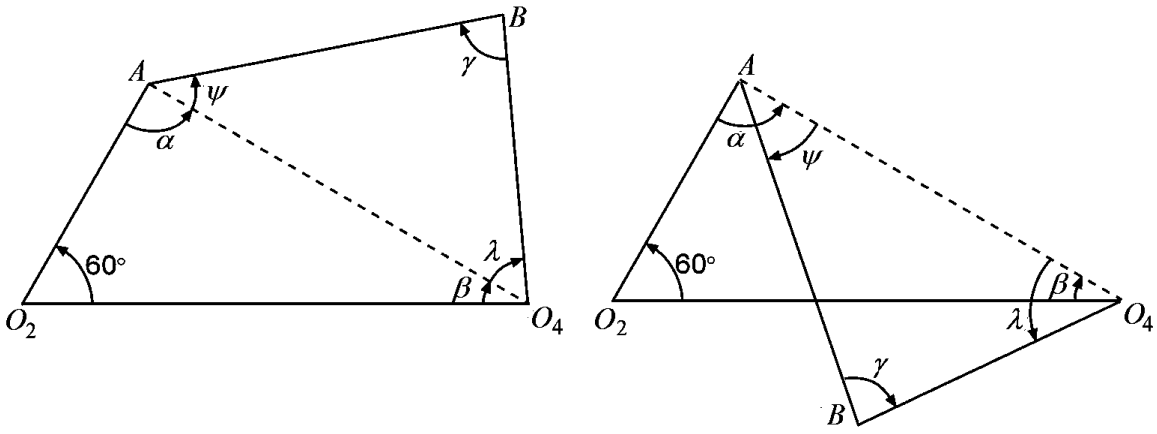

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

From measurements of the drawing, the answers for the coupler angle and the output angle are:

The Open Posture: $\theta_3 = 11^\circ$ and $\theta_4 = 95^\circ$

The Crossed Posture: $\theta_3 = -71^\circ$ or $+289^\circ$ and $\theta_4 = -155^\circ$ or $+205^\circ$

(*b*) Trigonometry. The notation for the open and crossed configurations of the four-bar linkage are shown in the following figure.

From the triangle AO_2O_4, the law of cosines gives

$$\overline{AO_4}^2 = R_1^2 + R_2^2 - 2R_1R_2\cos\theta_2$$

$$\overline{AO_4} = \sqrt{(14\text{ in})^2 + (7\text{ in})^2 - 2(14\text{ in})(7\text{ in})\cos 60^\circ} = 12.124\text{ in}$$

From the triangle O_2O_4A, the law of cosines gives

$$\beta = \cos^{-1}\frac{R_1^2 + \overline{AO_4}^2 - R_2^2}{2R_1\overline{AO_4}} = \cos^{-1}\frac{(14\text{ in})^2 + (12.124\text{ in})^2 - (7\text{ in})^2}{2(14\text{ in})(12.124\text{ in})} = -30^\circ$$

From the triangle O_4AB, the law of cosines gives

$$\psi = \cos^{-1}\frac{R_3^2 + \overline{AO_4}^2 - R_4^2}{2R_3\overline{AO_4}} = \cos^{-1}\frac{(10\text{ in})^2 + (12.124\text{ in})^2 - (8\text{ in})^2}{2(10\text{ in})(12.124\text{ in})} = \pm 41^\circ$$

$$\lambda = \cos^{-1}\frac{R_4^2 + \overline{AO_4}^2 - R_3^2}{2R_4\overline{AO_4}} = \cos^{-1}\frac{(8\text{ in})^2 + (12.124\text{ in})^2 - (10\text{ in})}{2(8\text{ in})(12.124\text{ in})} = \mp 55.10^\circ$$

From these, the angles for the open posture are

$$\theta_3 = \psi - \beta = 41^\circ - 30^\circ = 11^\circ \qquad \underline{Ans.}$$

$$\theta_4 = \pi - \beta - \lambda = 180^\circ - 30^\circ - 55.10^\circ = 94.90^\circ \qquad \underline{Ans.}$$

For the crossed posture, the angles are

$$\theta_3 = -\beta - \psi = -30^\circ - 41^\circ = -71^\circ = 289^\circ \qquad \underline{Ans.}$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

$$\theta_4 = \pi - \beta + \lambda = 180° - 30° + 55.10° = 205.10° = -154.90° \qquad \underline{Ans.}$$

(*c*) The vector loop equation can be written

$$\mathbf{R}_2 + \mathbf{R}_3 - \mathbf{R}_4 - \mathbf{R}_1 = \mathbf{0}$$

The horizontal and vertical components are

$$\begin{aligned} R_2\cos\theta_2 + R_3\cos\theta_3 - R_4\cos\theta_4 - R_1 &= 0 \\ R_2\sin\theta_2 + R_3\sin\theta_3 - R_4\sin\theta_4 &= 0 \end{aligned} \qquad (1)$$

Squaring, adding, and rearranging these gives us Freudenstein's equation. That is,

$$A\cos\theta_4 + B\sin\theta_4 = C \qquad (2)$$

where

$$\begin{aligned} A &= 2R_1R_4 - 2R_2R_4\cos\theta_2 \\ B &= -2R_2R_4\sin\theta_2 \\ C &= R_3^2 - R_4^2 - R_1^2 - R_2^2 + 2R_1R_2\cos\theta_2 \end{aligned}$$

Substituting the known data into these equations gives

$$A = 2(14\text{ in})(8\text{ in}) - 2(7\text{ in})(8\text{ in})\cos 60° = 168\text{ in}^2$$

$$B = -2(7\text{ in})(8\text{ in})\sin 60° = -97\text{ in}^2$$

$$C = (10\text{ in})^2 - (8\text{ in})^2 - (14\text{ in})^2 - (7\text{ in})^2 + 2(14\text{ in})(7\text{ in})\cos 60° = -111\text{ in}^2$$

which reduces Eq. (2) to the form

$$168\cos\theta_4 - 97\sin\theta_4 + 111 = 0 \qquad (3)$$

To solve this transcendental equation, we define

$$Z = \tan(\theta_4/2) \qquad (4)$$

which gives

$$\sin\theta_4 = \frac{2Z}{1+Z^2} \quad \text{and} \quad \cos\theta_4 = \frac{1-Z^2}{1+Z^2}$$

Substituting these into Eq. (3), and rearranging, gives

$$57Z^2 + 194 - 279 = 0$$

which has the solutions

$$Z = \frac{-97 \pm \sqrt{(-97)^2 - (57)(-279)}}{57}$$

$$= 1.089\ 43 \quad \text{or} \quad -4.492\ 94$$

Substituting these two roots back into Eq. (4) gives the two solutions

$$\theta_4 = 94.90° \quad \text{and} \quad \theta_4 = -154.90° = 205.10°.$$

The angular position of link 4, for the open posture shown is $\theta_4 = 94.90°$. *Ans.*

From this, Eqs. (1) gives $\theta_3 = 11.00°$. *Ans.*

The crossed posture gives $\theta_4 = -154.90°$ and $\theta_3 = -71.00° = 289.00°$. *Ans.*

(*d*) For the Newton-Raphson technique, the vector loop equation can be written

$$\mathbf{f} = \mathbf{R}_2 + \mathbf{R}_3 - \mathbf{R}_4 - \mathbf{R}_1 = \mathbf{0}$$

From this, the horizontal and vertical components are

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

$$f_x = R_2\cos\theta_2 + R_3\cos\theta_3 - R_4\cos\theta_4 - R_1 = 0$$
$$f_y = R_2\sin\theta_2 + R_3\sin\theta_3 - R_4\sin\theta_4 = 0$$

Expanding these to first order in Taylor series we find

$$R_2\cos\theta_2 + R_3\cos\theta_3 - R_3\sin\theta_3\Delta\theta_3 - R_4\cos\theta_4 + R_4\sin\theta_4\Delta\theta_4 - R_1 = 0$$
$$R_2\sin\theta_2 + R_3\sin\theta_3 + R_3\cos\theta_3\Delta\theta_3 - R_4\sin\theta_4 - R_4\cos\theta_4\Delta\theta_4 = 0$$

and, writing this in matrix format gives

$$\begin{bmatrix} R_3\sin\theta_3 & -R_4\sin\theta_4 \\ -R_3\cos\theta_3 & R_4\cos\theta_4 \end{bmatrix}\begin{bmatrix} \Delta\theta_3 \\ \Delta\theta_4 \end{bmatrix} = \begin{bmatrix} R_2\cos\theta_2 + R_3\cos\theta_3 - R_4\cos\theta_4 - R_1 \\ R_2\sin\theta_2 + R_3\sin\theta_3 - R_4\sin\theta_4 \end{bmatrix}$$

Substituting the given data this becomes

$$\begin{bmatrix} 10.0\sin\theta_3 & -8.0\sin\theta_4 \\ -10.0\cos\theta_3 & 8.0\cos\theta_4 \end{bmatrix}\begin{bmatrix} \Delta\theta_3 \\ \Delta\theta_4 \end{bmatrix} = \begin{bmatrix} -10.50000 + 10.0\cos\theta_3 - 8.0\cos\theta_4 \\ 6.06218 + 10.0\sin\theta_3 - 8.0\sin\theta_4 \end{bmatrix} \quad (5)$$

Using the graphic solution of part (a) as an estimate, $\theta_3 = 11°$ and $\theta_4 = 95°$, the first iteration equations are

$$\begin{bmatrix} 1.90809 & -7.96956 \\ -9.81627 & -0.69725 \end{bmatrix}\begin{bmatrix} \Delta\theta_3 \\ \Delta\theta_4 \end{bmatrix} = \begin{bmatrix} 0.01352 \\ 0.00071 \end{bmatrix}$$

which give corrections of $\Delta\theta_3 = 0.000\ 0471\ \text{rad} = 0.002\ 70°$, $\Delta\theta_4 = -0.001\ 68\ \text{rad} = -0.096\ 26°$.

Therefore, after one iteration, we have $\theta_3 = 11.002\ 70°$ and $\theta_4 = 94.903\ 74°$.

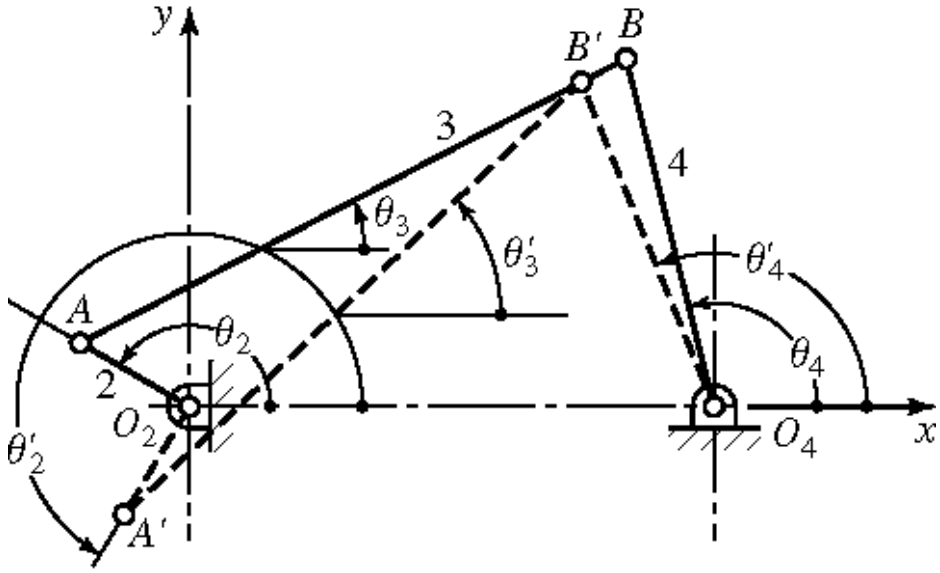

Substituting again into Eqs. (5) gives

$$\begin{bmatrix} 1.90855 & -7.97072 \\ -9.81618 & -0.68382 \end{bmatrix}\begin{bmatrix} \Delta\theta_3 \\ \Delta\theta_4 \end{bmatrix} = \begin{bmatrix} -0.00000099 \\ 0.000011312 \end{bmatrix}$$

This gives corrections of $\Delta\theta_3 = -1.142(10)^{-7}\ \text{rad} = -0.000\ 065\ 4°$, $\Delta\theta_4 = -1.49(10)^{-7}\ \text{rad} = -0.000\ 008\ 54°$..

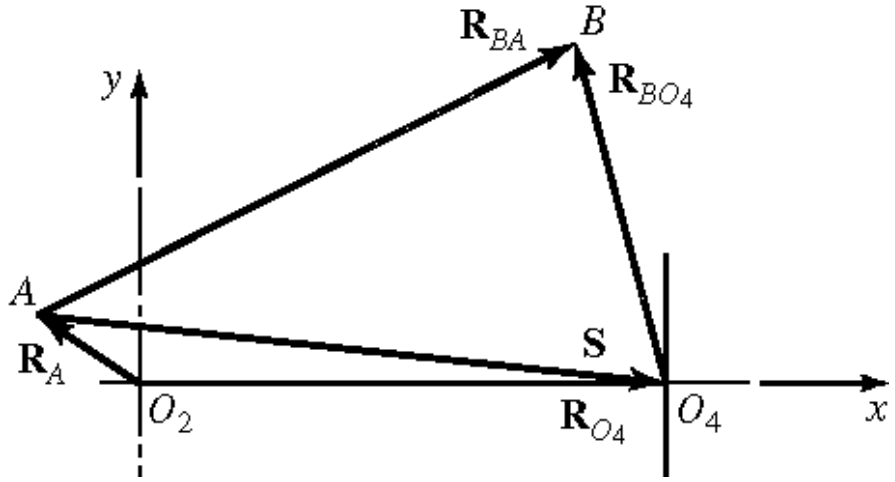

Therefore, after two iteration , we have $\theta_3 = 11.002\ 64°$ and $\theta_4 = 94.903\ 73°$. *Ans.*

2.34 A crank-rocker four-bar linkage is illustrated in two different postures for which $\theta_2 = 150°$ and $\theta_2' = 240°$. Determine θ_3 and θ_4 for the open posture and θ_3' and θ_4' for the crossed posture..

$R_{O_4O_2} = 600$ mm, $R_{AO_2} = 140$ mm, $R_{BA} = 690$ mm, and $R_{BO_4} = 400$ mm.

For the first input angle $\theta_2 = 150°$, to the following figure

and observe that

$$\mathbf{R}_A = 0.140 \text{ m}\angle 150°, \quad \text{and} \quad \mathbf{R}_{O_4} = 0.600 \text{ m}\angle 0°.$$

Therefore,

$$\mathbf{S} = \mathbf{R}_{O_4} - \mathbf{R}_A = 0.600 \text{ m}\angle 0° - 0.140 \text{ m}\angle 150° = 0.725 \text{ m}\angle -5.54°.$$

Referring again to the figure, we note that the vectors in the triangle ABO_4 are related by the equation

$$\overset{\surd\surd}{\mathbf{S}} = \overset{\surd ?}{\mathbf{R}}_{BA} - \overset{\surd ?}{\mathbf{R}}_{BO_4} \qquad (a)$$

There are two unknown orientations in this equation, and so we identify this as case 4. Using Eq. (2.49) and substituting **S** for **C**, R_{BA} for A, $-R_{BO4}$ for B, θ_S for θ_C, and θ_4 for θ_B

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

gives

$$\theta_4 = \theta_S \pm \cos^{-1}\frac{S^2 + R_{BO_4}^2 - R_{BA}^2}{2SR_{BO_4}}$$

$$= -5.54° \pm \cos^{-1}\frac{(0.725\text{ m})^2 + (-0.400\text{ m})^2 - (0.690\text{ m})^2}{2(0.725\text{ m})(-0.400\text{ m})}$$

$$= -5.54° \pm 111.18° = \underline{105.64°} \quad \text{or} \quad -116.72° \qquad \underline{\textit{Ans.}}$$

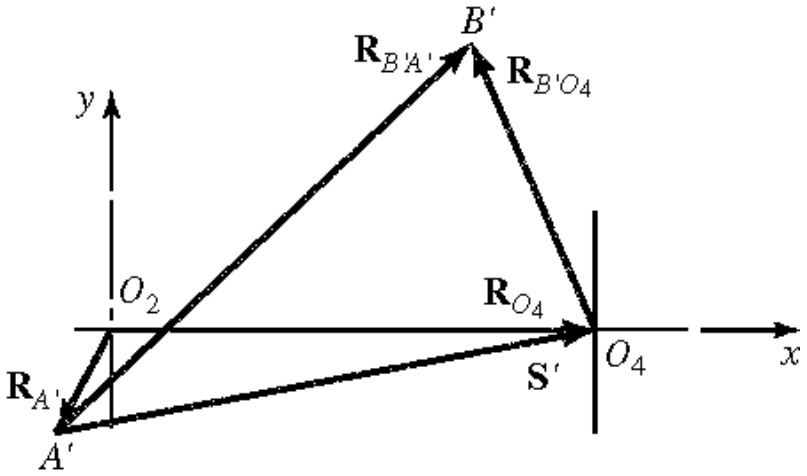

We note that we could have substituted R_{BO4}=+0.400 m for B and we would have obtained $\theta_4 + 180°$ for the final result.

Next, using Eq. (2.50) and substituting θ_3 for θ_A gives

$$\theta_3 = \theta_S \mp \cos^{-1}\frac{S^2 + R_{BA}^2 - R_{BO_4}^2}{2SR_{BA}}$$

$$= -5.54° \mp \cos^{-1}\frac{(0.725\text{ m})^2 + (0.690\text{ m})^2 - (-0.400\text{ m})^2}{2(0.725\text{ m})(0.690\text{ m})}$$

$$= -5.54° \mp 32.72° = -38.26° \quad \text{or} \quad \underline{27.18°} \qquad \underline{\textit{Ans.}}$$

We follow the same procedure for the second input angle $\theta_2' = 240°$. Using the figure above yields

$$\mathbf{S}' = \mathbf{R}_{O_4} - \mathbf{R}'_A = 0.600\text{ m}\angle 0° - 0.140\text{ m}\angle 240° = 0.681\text{ m}\angle 10.26°.$$

$$\theta_4' = 10.26° \pm \cos^{-1}\frac{(0.681\text{ m})^2 + (-0.400\text{ m})^2 - (0.690\text{ m})^2}{2(0.681\text{ m})(-0.400\text{ m})}$$

$$= 10.26° \pm 105.73° = \underline{115.99°} \quad \text{or} \quad -95.47° \qquad \underline{\textit{Ans.}}$$

$$\theta_3' = 10.26° \mp \cos^{-1}\frac{(0.681\text{ m})^2 + (0.690\text{ m})^2 - (-0.400\text{ m})^2}{2(0.681\text{ m})(0.690\text{ m})}$$

$$= 10.26° \mp 33.92° = -23.66° \quad \text{or} \quad \underline{44.18°} \qquad \underline{\textit{Ans.}}$$

We recognize the positive angles as the solutions of interest in all cases.

Chapter 3
Velocity

3.1 The position vector of a point is given by the equation $\mathbf{R} = 100e^{j\pi t}$, where R is in inches. Find the velocity of the point at $t = 0.40$ s.

$$\mathbf{R}(t) = 100e^{j\pi t} \text{ in}$$
$$\dot{\mathbf{R}}(t) = j\pi 100e^{j\pi t} \text{ in/s}$$
$$\dot{\mathbf{R}}(0.40\text{s}) = j\pi 100e^{j\pi 0.40} \text{ in/s}$$
$$= j\pi 100(\cos 0.40\pi + j\sin 0.40\pi) \text{ in/s}$$
$$= -100\pi \sin 72° \text{ in/s} + j100\pi \cos 72° \text{ in/s}$$
$$\dot{\mathbf{R}}(0.40\text{s}) = -298.783 + j97.080 \text{ in/s} = 314.159 \text{ in/s}\angle 162° \quad \underline{\textit{Ans.}}$$

3.2 The path of a point is defined by the equation $\mathbf{R} = (t^2 + 4)e^{-j\pi t/10}$, where R is in meters. Find the velocity of the point at $t = 20$ s.

$$\mathbf{R}(t) = (t^2 + 4)e^{-j\pi t/10}$$
$$\dot{\mathbf{R}}(t) = 2te^{-j\pi t/10} - (j\pi/10)(t^2 + 4)e^{-j\pi t/10}$$
$$\dot{\mathbf{R}}(20\text{ s}) = 40e^{-j\pi 20/10} - (j\pi/10)(20^2 + 4)e^{-j\pi 20/10}$$
$$= 40e^{-j2\pi} - j\pi 40.4e^{-j2\pi}$$
$$\dot{\mathbf{R}}(20\text{ s}) = 40.000 - j126.920 \text{ m/s} = 133.074 \text{ m/s}\angle -72.51° \quad \underline{\textit{Ans.}}$$

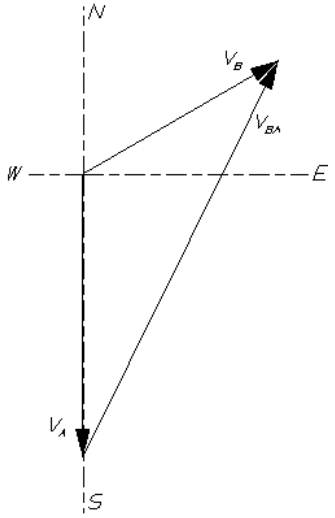

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.3 Automobile *A* is traveling south at 55 mi/h and automobile *B* is travelling north 60° east at 40 mi/h. Find the velocity difference between *B* and *A* and the apparent velocity of *B* to the driver of *A*?

$$\mathbf{V}_A = 55 \text{ mi/h} \angle -90° = -55\hat{\mathbf{j}} \text{ mi/h}$$
$$\mathbf{V}_B = 40 \text{ mi/h} \angle 30° = 34.641\hat{\mathbf{i}} + 20\hat{\mathbf{j}} \text{ mi/h}$$

$$\mathbf{V}_{BA} = \mathbf{V}_B - \mathbf{V}_A = 34.641\hat{\mathbf{i}} + 75\hat{\mathbf{j}} \text{ mi/h}$$
$$\mathbf{V}_{BA} = 82.613 \text{ mi/h} \angle 65.2° = 82.613 \text{ mi/h N } 24.8° \text{ E}$$

Ans.

Naming *B* as car 3 and *A* as car 2, we have $\mathbf{V}_{B_2} = \mathbf{V}_A$ since car 2 is translating. Then $\mathbf{V}_{B_3/2} = \mathbf{V}_{B_3} - \mathbf{V}_{B_2} = \mathbf{V}_{BA}$

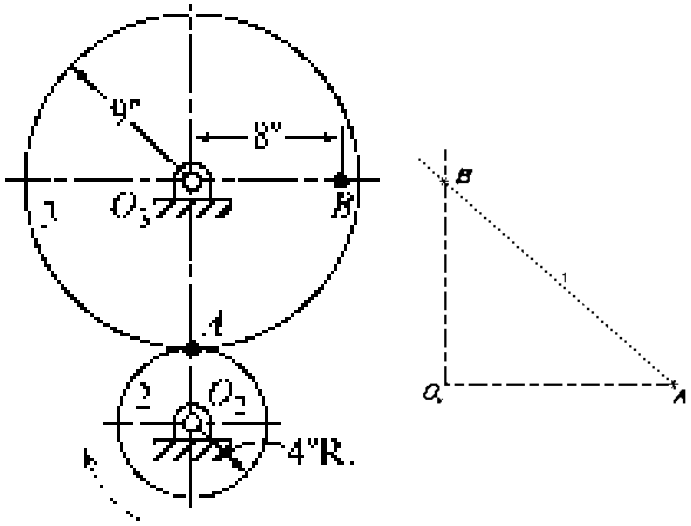

$$\mathbf{V}_{B_3/2} = 82.613 \text{ mi/h} \angle 65.2° = 82.613 \text{ mi/h N } 24.8° \text{ E}$$ *Ans.*

3.4 Wheel 2 rotates at 600 rev/min cw and drives wheel 3 without slipping. Find the velocity difference between points *B* and *A*.

$$\omega_2 = \frac{(600 \text{ rev/min})(2\pi \text{ rad/rev})}{60 \text{ s/min}}$$
$$= 20\pi \text{ rad/s cw}$$
$$V_{AO_2} = \omega_2 R_{AO_2} = 80\pi = 251 \text{ in/s}$$
$$\mathbf{V}_{BA} = \mathbf{V}_B - \mathbf{V}_A$$

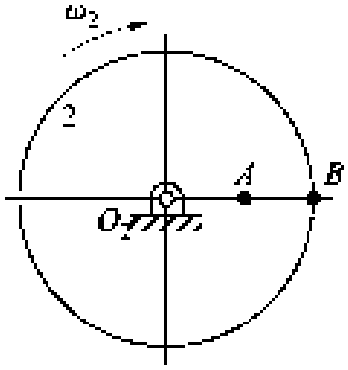

Construct the velocity polygon

$$\mathbf{V}_B = 223 \text{ in/s} \angle 90°$$
$$\mathbf{V}_{BA} = -251\hat{\mathbf{i}} + 223\hat{\mathbf{j}} \text{ in/s}$$
$$= 335.75 \text{ in/s} \angle 138.4°$$ *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.5 The distance between points A and B, located along the radius of a wheel, is $R_{BA} = 300$ mm. The speeds of points A and B are V_A = 80 m/s and V_B = 140 m/s, respectively. Find the diameter of the wheel; the velocities $\mathbf{V}_{AB}$ and $\mathbf{V}_{BA}$; and the angular velocity of the wheel.

$$\mathbf{V}_{AB} = \mathbf{V}_A - \mathbf{V}_B = \left(-80\hat{\mathbf{j}}\right) - \left(-140\hat{\mathbf{j}}\right) = 60\hat{\mathbf{j}} \text{ m/s} \qquad \underline{Ans.}$$

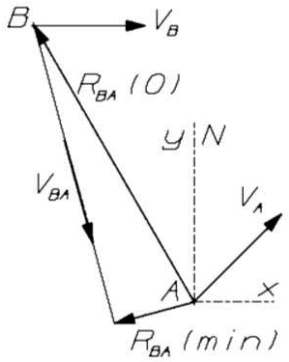

$$\mathbf{V}_{BA} = \mathbf{V}_B - \mathbf{V}_A = \left(-140\hat{\mathbf{j}}\right) - \left(-80\hat{\mathbf{j}}\right) = -60\hat{\mathbf{j}} \text{ m/s} \qquad \underline{Ans.}$$

$$\omega_2 = \frac{V_{AB}}{R_{AB}} = \frac{60 \text{ m/s}}{0.300 \text{ m}} = 200 \text{ rad/s cw} \qquad \underline{Ans.}$$

$$R_{BO_2} = \frac{V_{BO_2}}{\omega_2} = \frac{140 \text{ m/s}}{200 \text{ rad/s}} = 0.700 \text{ m} = 700 \text{ mm}$$

$$\text{Dia} = 2R_{BO_2} = 2(0.7 \text{ m}) = 1.4 \text{ m} = 1\,400 \text{ mm} \qquad \underline{Ans.}$$

3.6 An airplane takes off from point B and flies east at 350 mi/h. Simultaneously, another airplane at point A, 200 miles southeast, takes off and flies northeast at 390 mi/h. (*a*) How close will the airplanes come to each other if they fly at the same altitude? (*b*) If both airplanes leave at 6:00 p.m., at what time will this occur?

$\mathbf{V}_A = 390\angle 45° \text{ mi/h} = 276\hat{\mathbf{i}} + 276\hat{\mathbf{j}} \text{ mi/h}$; $\mathbf{V}_B = 350\hat{\mathbf{i}} \text{ mi/h}$

$\mathbf{V}_{BA} = \mathbf{V}_B - \mathbf{V}_A = 74\hat{\mathbf{i}} - 276\hat{\mathbf{j}} \text{ mi/h}$

At initial time $\mathbf{R}_{BA}(0) = 200 \text{ mi}\angle 120° = -100\hat{\mathbf{i}} + 173\hat{\mathbf{j}} \text{ mi}$

Later $\mathbf{R}_{BA}(t) = \mathbf{R}_{BA}(0) + \mathbf{V}_{BA}t = \left(-100 + 74t\right)\hat{\mathbf{i}} + \left(173 - 276t\right)\hat{\mathbf{j}} \text{ mi}$

To find the minimum of this: $R_{BA}^2 = \left(-100 + 74t\right)^2 + \left(173 - 276t\right)^2$

$dR_{BA}^2/dt = 2\left(-100 + 74t\right)(74) + 2\left(173 - 276t\right)(-276) = 0$

$163\,120t - 110\,376 = 0$; $t = 0.677 \text{ h} = 41 \text{ min}$ or 6:41p.m. $\underline{Ans.}$ $R_{AB} = 200 \text{ mi}$

$\mathbf{R}_{BA}(0.677 \text{ h}) = -49.8\hat{\mathbf{i}} - 13.4\hat{\mathbf{j}} = 51.5 \text{ mi}\angle -165° \qquad \underline{Ans.}$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.7 Include a wind of 30 mi/h from the west with the data of Problem 3.6. (*a*) If airplane *A* flies the same heading, what is its new path? (*b*) What change does the wind make in the results of Problem 3.6?

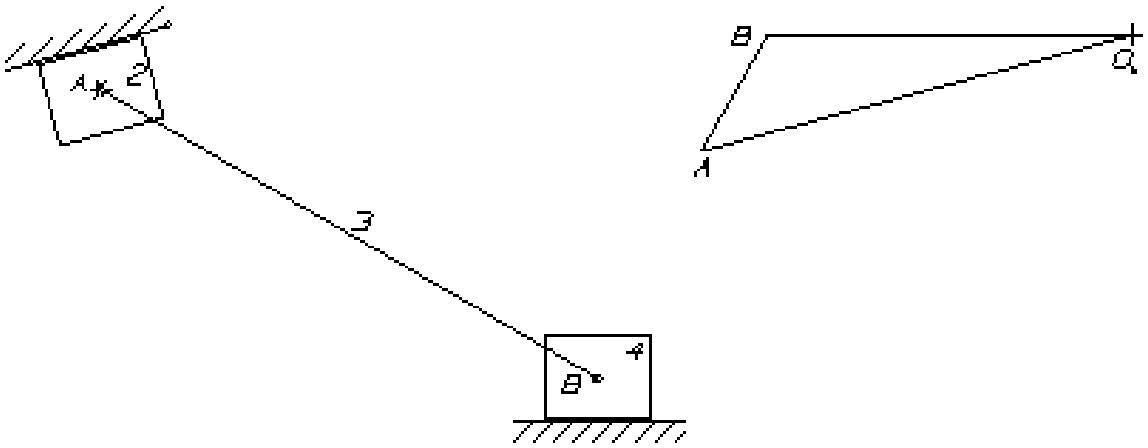

With the added wind $\mathbf{V}_A = 306\hat{\mathbf{i}} + 276\hat{\mathbf{j}}$ mi/h $= 412$ mi/h$\angle 42°$; $\mathbf{V}_B = 380\hat{\mathbf{i}}$ mi/h *Ans.*

$\mathbf{V}_{BA} = \mathbf{V}_B - \mathbf{V}_A = 74\hat{\mathbf{i}} - 276\hat{\mathbf{j}}$ mi/h

Since the velocities are constant, the new path is a straight line at N 48° E.

Since the velocities of both planes change by the same amount, the velocity difference $\mathbf{V}_{BA}$ does not change. Therefore the results of Problem 3.6 do not change. *Ans.*

3.8 For the double-slider linkage in the posture illustrated, the velocity of point *B* is 40 m/s. Find the velocity of point *A* and the angular velocity of link 3.

$R_{AB} = 400$ mm

$\mathbf{V}_A \overset{?\surd}{=} \mathbf{V}_B \overset{\surd\surd}{+} \mathbf{V}_{AB} \overset{?\surd}{}$

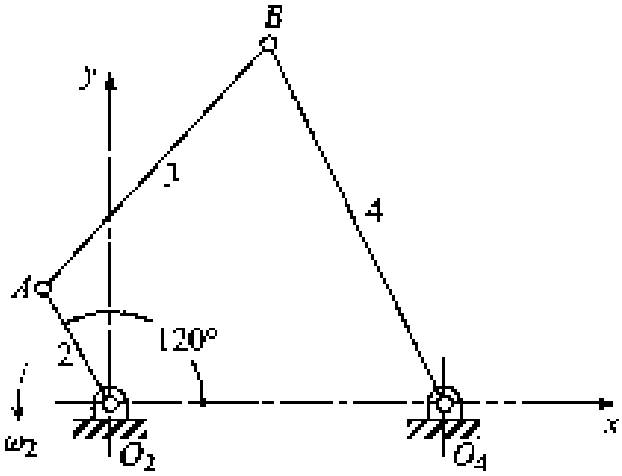

$\mathbf{V}_A = 48.99$ m/s$\angle -165°$ *Ans.*

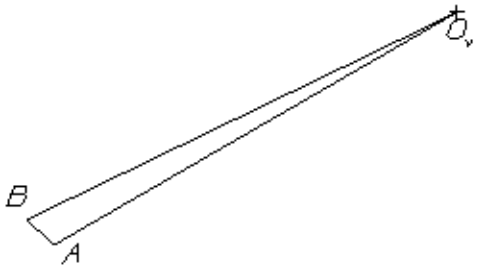

$\mathbf{V}_{AB} = 14.64$ m/s$\angle -120°$

$\omega_3 = \dfrac{V_{AB}}{R_{AB}} = \dfrac{14.64 \text{ m/s}}{0.400 \text{ m}} = 36.60$ rad/s ccw *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.9 The four-bar linkage in the posture illustrated is driven by crank 2 at $\omega_2 = 45$ rad/s ccw. Find the angular velocities of links 3 and 4.

$$R_{AO_2} = 4 \text{ in}, \quad R_{BA} = 10 \text{ in}, \quad R_{O_4O_2} = 10 \text{ in}, \text{ and } R_{BO_4} = 12 \text{ in}.$$

$$V_{AO_2} = \omega_2 R_{AO_2} = (45 \text{ rad/s})(4 \text{ in}) = 180 \text{ in/s}$$

$$\mathbf{V}_B = \overset{\surd\surd}{\mathbf{V}}_A + \overset{?\surd}{\mathbf{V}}_{BA} = \cancel{\mathbf{V}}_{O_4} + \overset{?\surd}{\mathbf{V}}_{BO_4}$$

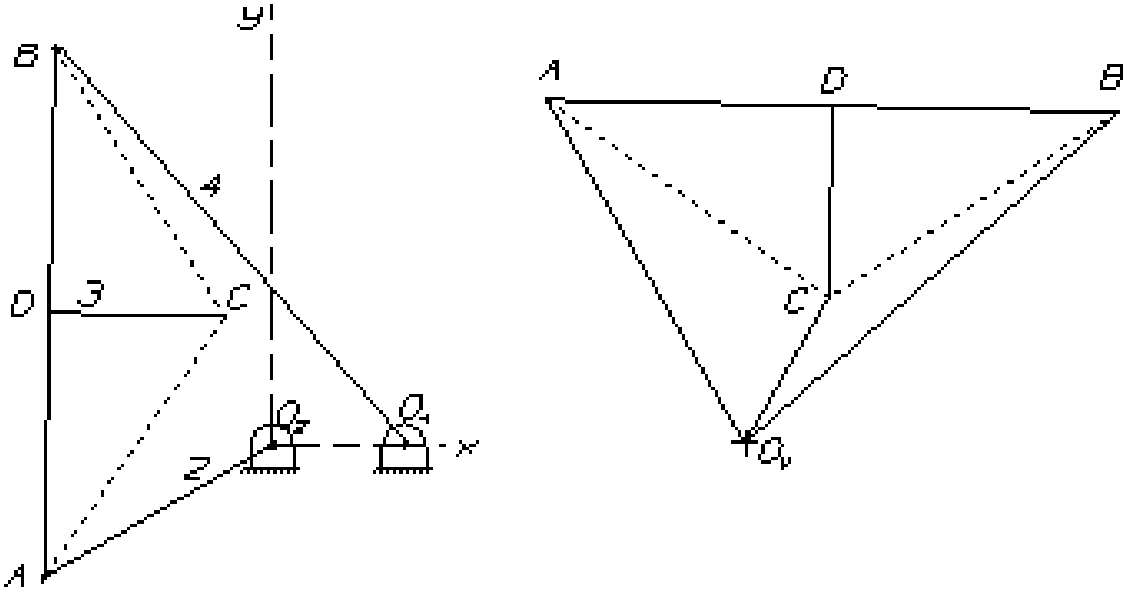

$$V_{BA} = 14.34 \text{ in/s}; \; V_{BO_4} = 184.76 \text{ in/s}.$$

$$\omega_3 = \frac{V_{BA}}{R_{BA}} = \frac{14.34 \text{ in/s}}{10 \text{ in}} = 1.43 \text{ rad/s ccw} \qquad \underline{\textit{Ans.}}$$

$$\omega_4 = \frac{V_{BO_4}}{R_{BO_4}} = \frac{184.76 \text{ in/s}}{12 \text{ in}} = 15.40 \text{ rad/s ccw} \qquad \underline{\textit{Ans.}}$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.10 The four-bar linkage in the posture illustrated is driven by crank 2 at $\omega_2 = 60$ rad/s cw. Find the angular velocities of links 3 and 4 and the velocity of pin *B* and point *C* on link 3.

$R_{AO_2} = 150$ mm, $R_{BA} = 300$ mm, $R_{O_4O_2} = 75$ mm, $R_{BO_4} = 300$ mm, $R_{DA} = 150$ mm, and $R_{CD} = 100$ mm.

$$V_{AO_2} = \omega_2 R_{AO_2} = (60 \text{ rad/s})(0.150 \text{ m}) = 9.0 \text{ m/s}$$

$$\mathbf{V}_B = \overset{\surd\surd}{\mathbf{V}}_A + \overset{?\surd}{\mathbf{V}}_{BA} = \cancel{\mathbf{V}}_{O_4} + \overset{?\surd}{\mathbf{V}}_{BO_4}$$

$V_{BA} = 13.020$ m/s ; $\mathbf{V}_B = 11.360$ m/s$\angle 41°$ *Ans.*

$$\mathbf{V}_C = \overset{\surd\surd}{\mathbf{V}}_A + \overset{?\surd}{\mathbf{V}}_{CA} = \overset{\surd\surd}{\mathbf{V}}_B + \overset{?\surd}{\mathbf{V}}_{CB}$$

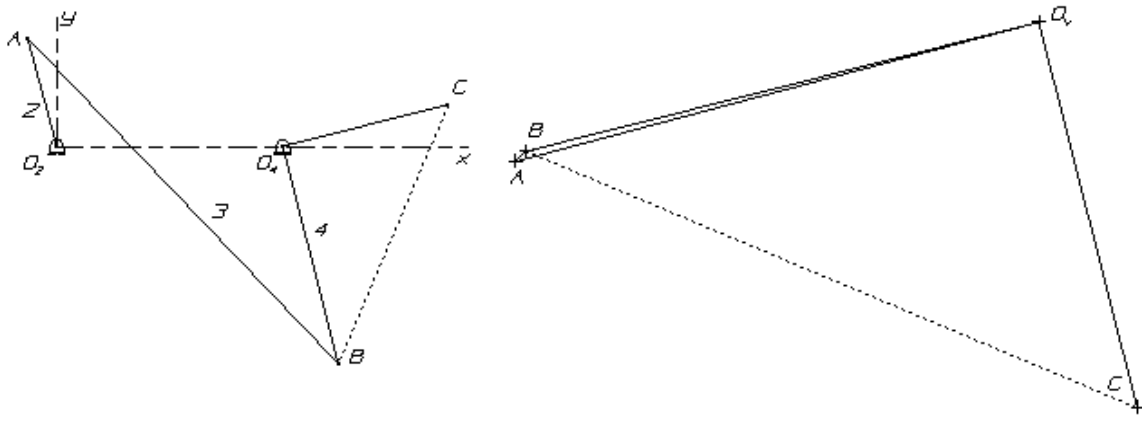

$\mathbf{V}_C = 3.830$ m/s$\angle 60°$ *Ans.*

$$\omega_3 = \frac{V_{BA}}{R_{BA}} = \frac{13.020 \text{ m/s}}{0.300 \text{ m}} = 43.40 \text{ rad/s cw}$$ *Ans.*

$$\omega_4 = \frac{V_{BO_4}}{R_{BO_4}} = \frac{11.360 \text{ m/s}}{0.300 \text{ m}} = 37.87 \text{ rad/s cw}$$ *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.11 The four-bar linkage in the posture illustrated is driven by crank 2 at $\omega_2 = 48$ rad/s ccw. Find the angular velocity of link 3 and the velocity of point *C* on link 4

$$R_{AO_2} = 8 \text{ in},\ R_{BA} = 32 \text{ in},\ R_{O_4O_2} = 16 \text{ in},\ R_{BO_4} = 16 \text{ in, and } R_{CO_4} = 12 \text{ in.}$$

$$V_{AO_2} = \omega_2 R_{AO_2} = (48 \text{ rad/s})(8.0 \text{ in}) = 384.0 \text{ in/s}$$

$$\mathbf{V}_B = \overset{\surd\surd}{\mathbf{V}}_A + \overset{?\surd}{\mathbf{V}}_{BA} = \cancel{\mathbf{V}}_{O_4} + \overset{?\surd}{\mathbf{V}}_{BO_4}$$

$$V_{BA} = 10.7 \text{ in/s}$$

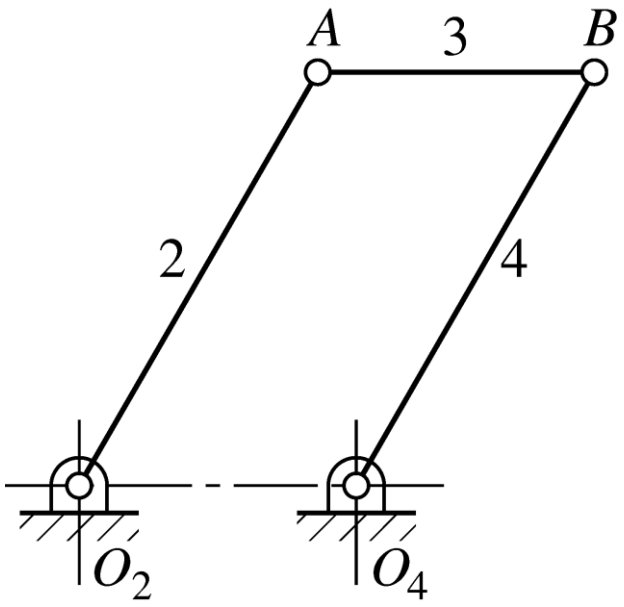

$$\mathbf{V}_C = \cancel{\mathbf{V}}_{O_4} + \overset{?\surd}{\mathbf{V}}_{CO_4} = \overset{\surd\surd}{\mathbf{V}}_B + \overset{?\surd}{\mathbf{V}}_{CB}$$

$$\mathbf{V}_C = 284.7 \text{ in/s} \angle -75.8° \qquad \underline{\textit{Ans.}}$$

$$\omega_3 = \frac{V_{BA}}{R_{BA}} = \frac{10.7 \text{ in/s}}{32.0 \text{ in}} = 0.335 \text{ rad/s ccw} \qquad \underline{\textit{Ans.}}$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.12 For the parallelogram four-bar linkage, demonstrate that ω_3 is always zero and that $\omega_4 = \omega_2$. How would you describe the motion of link 4 with respect to link 2?

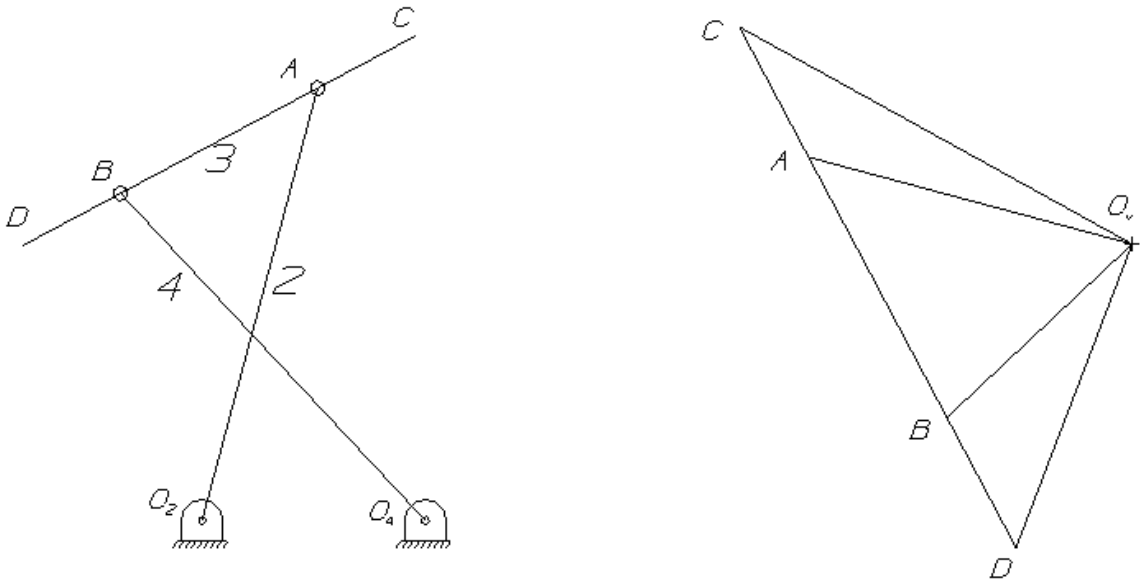

Referring to Fig. 2.19 and using $r_1 = r_3$ and $r_2 = r_4$, we compare Eqs. (2.26) and (2.27) to see that $\psi = \beta$. Then Eq. (2.29) gives $\theta_3 = 0$ and its derivative is $\omega_3 = 0$. *Ans.*

Next we substitute Eq. (2.25) into Eq. (2.33) to see that $\gamma = \theta_2$.
Then Fig. 2.19 shows that, since link 3 is parallel to link 1 $(\theta_3 = 0)$,
then $\theta_4 = \gamma = \theta_2$. Finally, the derivative of this gives $\omega_4 = \omega_2$. *Ans.*

Since $\omega_{4/2} = \omega_4 - \omega_2 = 0$, link 4 is in curvilinear translation with respect to link 2. *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.13 The antiparallel, or crossed, four-bar linkage in the posture illustrated is driven by link 2 at $\omega_2 = 1$ rad/s ccw. Find the velocities of points *C* and *D*.

$R_{AO_2} = R_{BO_4} = 300$ mm, $R_{BA} = R_{O_4O_2} = 150$ mm, and $R_{CA} = R_{DB} = 75$ mm

$V_{AO_2} = \omega_2 R_{AO_2} = (1 \text{ rad/s})(0.300 \text{ m}) = 0.300 \text{ m/s}$

$\mathbf{V}_B = \overset{\surd\surd}{\mathbf{V}}_A + \overset{?\surd}{\mathbf{V}}_{BA} = \cancel{\mathbf{V}}_{O_4} + \overset{?\surd}{\mathbf{V}}_{BO_4}$

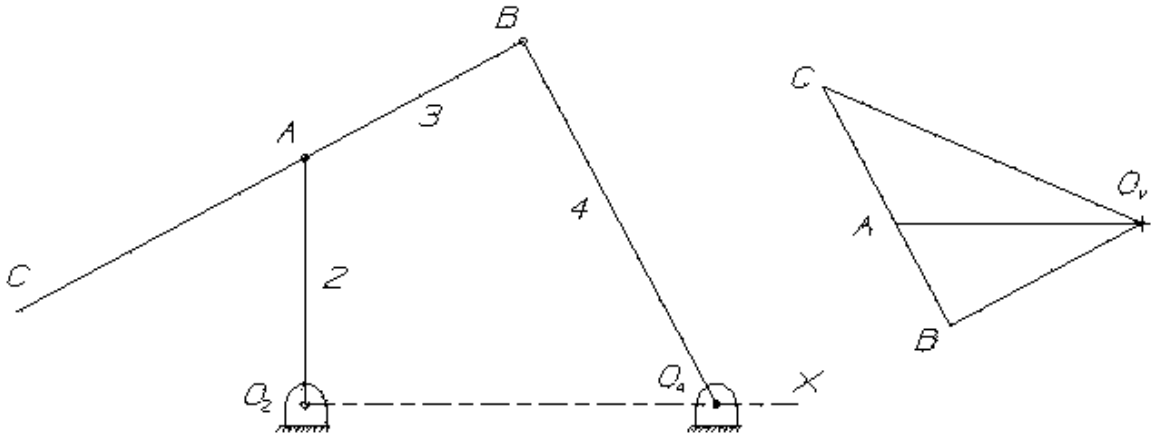

Construct the velocity image of link 3.

$\mathbf{V}_C = 0.402 \text{ m/s} \angle 151°$ *Ans.*

$\mathbf{V}_D = 0.290 \text{ m/s} \angle -111°$ *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.14 For the four-bar linkage in the posture illustrated**,** link 2 has an angular velocity of 60 rad/s ccw. Find the angular velocities of links 3 and 4 and the velocity of point ***C***.

$R_{AO_2} = R_{BA} = 6$ in, $R_{O_4O_2} = R_{BO_4} = 10$ in, and $R_{CA} = 8$ in.

$V_{AO_2} = \omega_2 R_{AO_2} = (60 \text{ rad/s})(6.0 \text{ in}) = 360.0 \text{ in/s}$

$\mathbf{V}_B = \overset{\surd\surd}{\mathbf{V}}_A + \overset{?\surd}{\mathbf{V}}_{BA} = \not{\mathbf{V}}_{O_4} + \overset{?\surd}{\mathbf{V}}_{BO_4}$

Construct the velocity image of link 3:

$\mathbf{V}_C = 507.1 \text{ in/s} \angle 156.9°$ *Ans.*

$V_{BA} = 169.4 \text{ in/s}$;

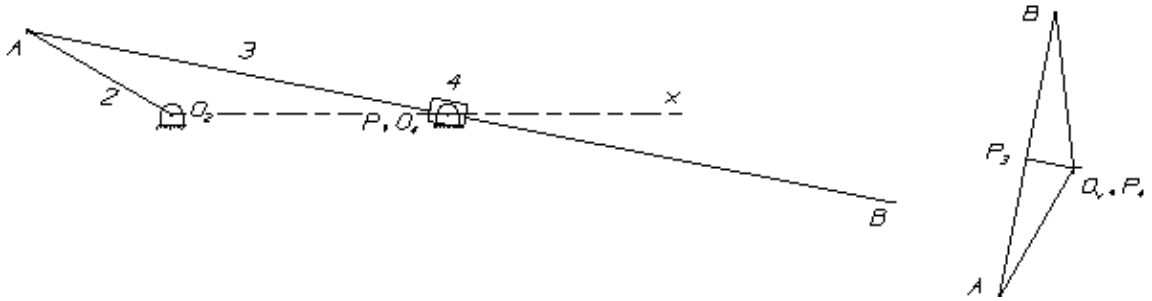

$V_{BO_4} = 317.6 \text{ in/s}$

$$\omega_3 = \frac{V_{BA}}{R_{BA}} = \frac{169.4 \text{ in/s}}{6.0 \text{ in}} = 28.24 \text{ rad/s cw}$$ *Ans.*

$$\omega_4 = \frac{V_{BO_4}}{R_{BO_4}} = \frac{317.6 \text{ in/s}}{10.0 \text{ in}} = 31.76 \text{ rad/s ccw}$$ *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.15 Crank 2 of the inverted slider-crank linkage, in the posture illustrated, is driven at $\omega_2 = 60$ rad/s ccw. Find the angular velocities of links 3 and 4 and the velocity of point *B*.

$R_{AO_2} = 75$ mm, $R_{BA} = 400$ mm, and $R_{O_4O_2} = 125$ mm.

$$V_{AO_2} = \omega_2 R_{AO_2} = (60 \text{ rad/s})(0.075 \text{ m}) = 4.500 \text{ m/s}$$

$$\mathbf{V}_{P_3} = \overset{\surd\surd}{\mathbf{V}}_A + \overset{?\surd}{\mathbf{V}}_{P_3A} = \not{\mathbf{V}}_{P_4} + \overset{?\surd}{\mathbf{V}}_{P_3/4}$$

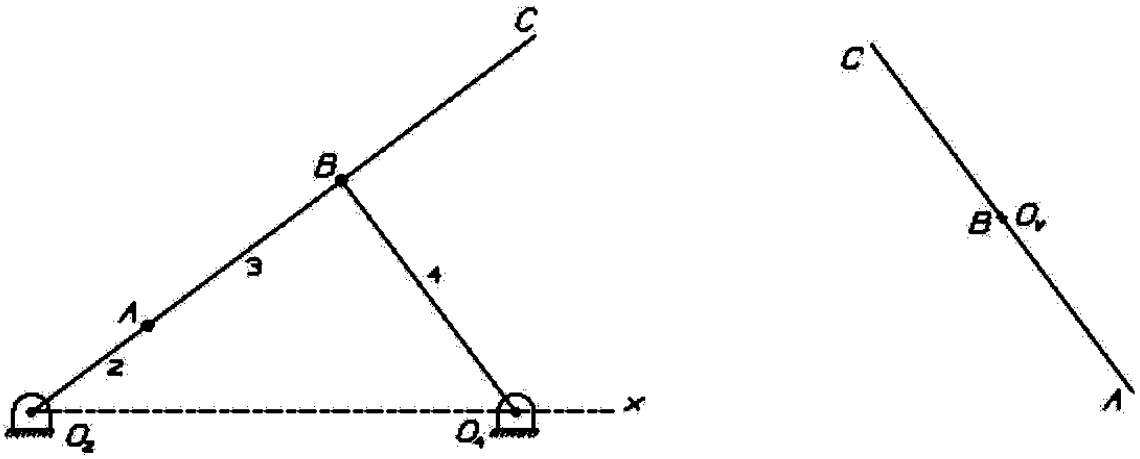

Construct the velocity image of link 3:

$\mathbf{V}_B = 4.789 \text{ m/s} \angle 96.5°$ *Ans.*

$$\omega_4 = \omega_3 = \frac{V_{P_3A}}{R_{P_3A}} = \frac{4.259 \text{ m/s}}{0.194 \text{ m}} = 22.0 \text{ rad/s ccw}$$ *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.16 For the four-bar linkage in the posture illustrated, crank 2 has an angular velocity of 30 rad/s cw. Find the velocity of the coupler point *C* and the angular velocities of links 3 and 4.

$R_{AO_2} = 3$ in, $R_{BA} = R_{CB} = 5$ in, $R_{O_4O_2} = 10$ in, and $R_{BO_4} = 6$ in.

$V_{AO_2} = \omega_2 R_{AO_2} = (30 \text{ rad/s})(3.0 \text{ in}) = 90.0 \text{ in/s}$

$\mathbf{V}_B = \overset{\surd\surd}{\mathbf{V}}_A + \overset{?\surd}{\mathbf{V}}_{BA} = \cancel{\mathbf{V}}_{O_4} + \overset{?\surd}{\mathbf{V}}_{BO_4}$

Construct the velocity image of link 3:

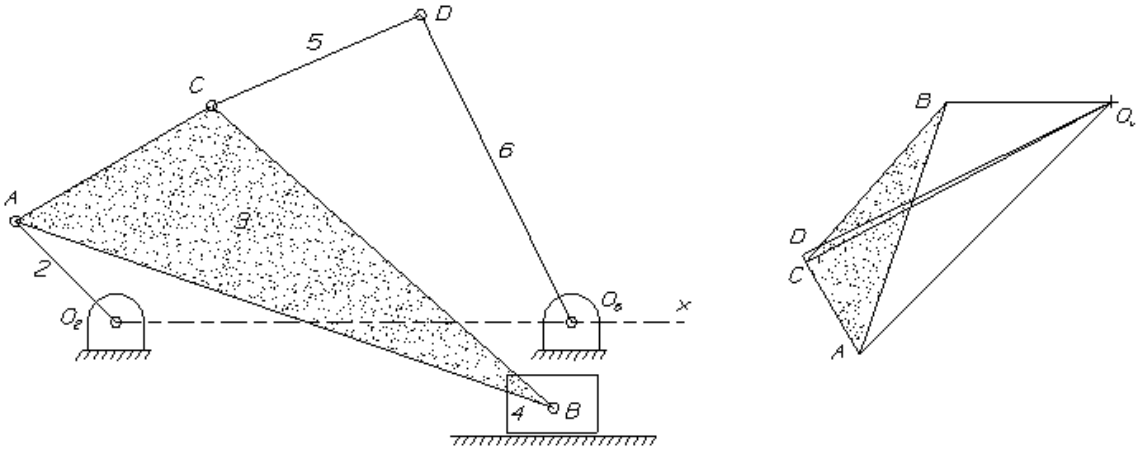

$\mathbf{V}_C = 90.0 \text{ in/s} \angle 126.9°$ *Ans.*

$\omega_3 = \dfrac{V_{BA}}{R_{BA}} = \dfrac{90.0 \text{ in/s}}{5.0 \text{ in}} = 18.00 \text{ rad/s ccw};$ *Ans.*

$\omega_4 = \dfrac{V_{BO_4}}{R_{BO_4}} = \dfrac{0}{8.0 \text{ in}} = 0$ *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.17 For the modified slider-crank linkage in the posture illustrated, crank 2 has an angular velocity of 10 rad/s ccw. Find the angular velocity of link 6 and the velocities of points *B, C,* and *D*.

$R_{AO_2} = 2.5$ in, $R_{BA} = 10$ in, $R_{CB} = 8$ in, $R_{CA} = R_{DC} = 4$ in, $R_{O_6O_2} = 8$ in, and $R_{DO_6} = 6$ in.

$V_{AO_2} = \omega_2 R_{AO_2} = (10 \text{ rad/s})(2.5 \text{ in}) = 25.0 \text{ in/s}$

$\overset{?\surd}{\mathbf{V}}_B = \overset{\surd\surd}{\mathbf{V}}_A + \overset{?\surd}{\mathbf{V}}_{BA}$

$\mathbf{V}_B = 11.57 \text{ in/s} \angle 180°$ *Ans.*

Construct velocity image of link 3:

$\overset{??}{\mathbf{V}}_C = \overset{\surd\surd}{\mathbf{V}}_A + \overset{?\surd}{\mathbf{V}}_{CA} = \overset{\surd\surd}{\mathbf{V}}_B + \overset{?\surd}{\mathbf{V}}_{CB}$

$\mathbf{V}_C = 24.22 \text{ in/s} \angle 207.6°$ *Ans.*

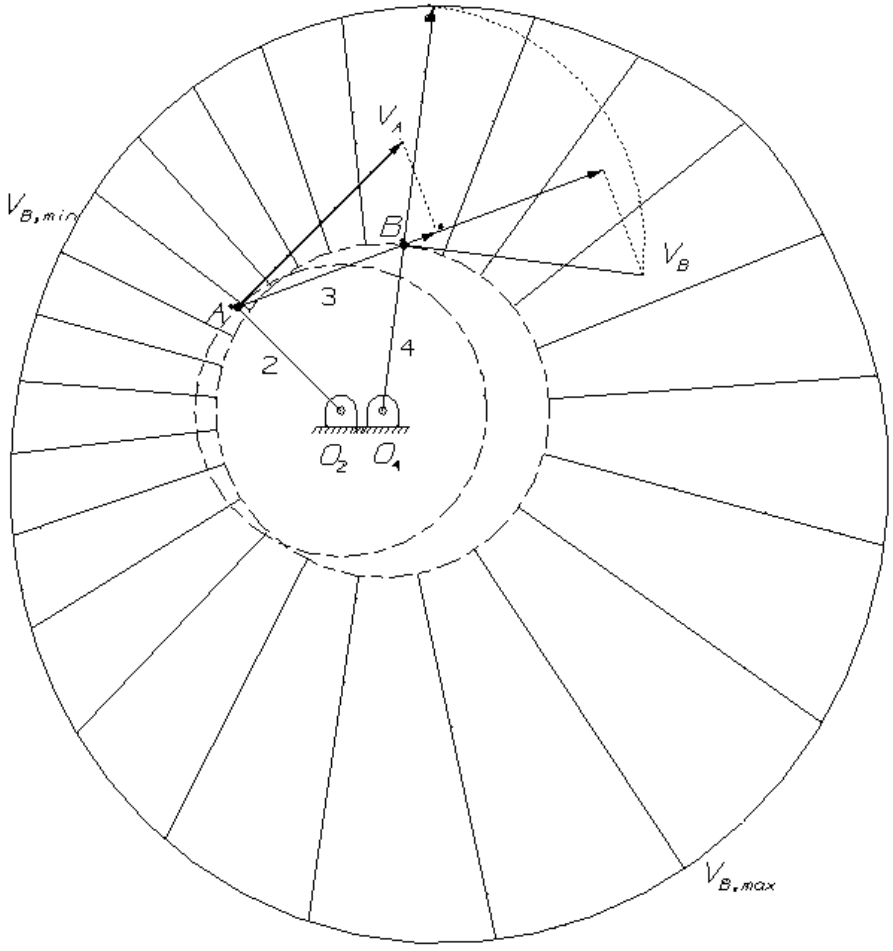

$\overset{??}{\mathbf{V}}_D = \overset{\surd\surd}{\mathbf{V}}_C + \overset{?\surd}{\mathbf{V}}_{DC} = \mathbf{V}_{O_6} + \overset{?\surd}{\mathbf{V}}_{DO_6}$

$\mathbf{V}_D = 24.18 \text{ in/s} \angle 206.2°$ *Ans.*

$$\omega_6 = \frac{V_{DO_6}}{R_{DO_6}} = \frac{24.18 \text{ in/s}}{6.0 \text{ in}} = 4.03 \text{ rad/s ccw}$$ *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.18 For the four-bar linkage illustrated, the angular velocity of crank 2 is a constant 16 rad/s cw. Plot a polar velocity diagram for the velocity of point *B* for all crank positions. Check the positions of maximum and minimum velocities by using Freudenstein's theorem.

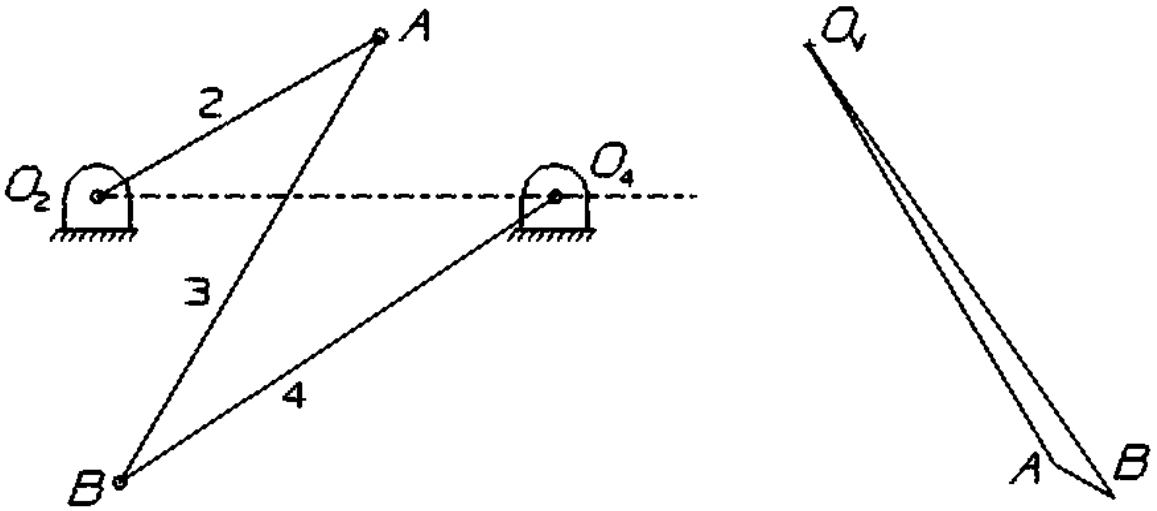

$R_{AO_2} = 350$ mm, $R_{BA} = 425$ mm, $R_{O_4O_2} = 100$ mm, and $R_{BO_4} = 400$ mm.

The graphic construction is shown in the posture where $\theta_2 = 135°$, where the result is $\mathbf{V}_B = 5.76 \text{ m/s} \angle -7.2°$. It is repeated at increments of $\Delta\theta_2 = 15°$. The maximum and minimum velocities are $\mathbf{V}_{B,max} = 9.13 \text{ m/s} \angle -146.6°$ at $\theta_2 = 15°$ and $\mathbf{V}_{B,min} = 4.59 \text{ m/s} \angle 63.7°$ at $\theta_2 = 225°$, respectively. Within graphic accuracy these two positions approximately verify Freudenstein's theorem.

A numeric solution for the same problem can be found from Eq. (3.22) using Eqs. (2.25) through (2.33) for position values. The accuracy of the values reported above have been verified in this manner.

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.19 For the four-bar linkage in the posture illustrated, link 2 is driven at $\omega_2 = 36$ rad/s cw. Find the angular velocity of link 3 and the velocity of point *B*.

$R_{AO_2} = 5$ in, $R_{BA} = R_{BO_4} = 8$ in, and $R_{O_4O_2} = 7$ in.

$$V_{AO_2} = \omega_2 R_{AO_2} = (36 \text{ rad/s})(5.0 \text{ in}) = 180.0 \text{ in/s}$$

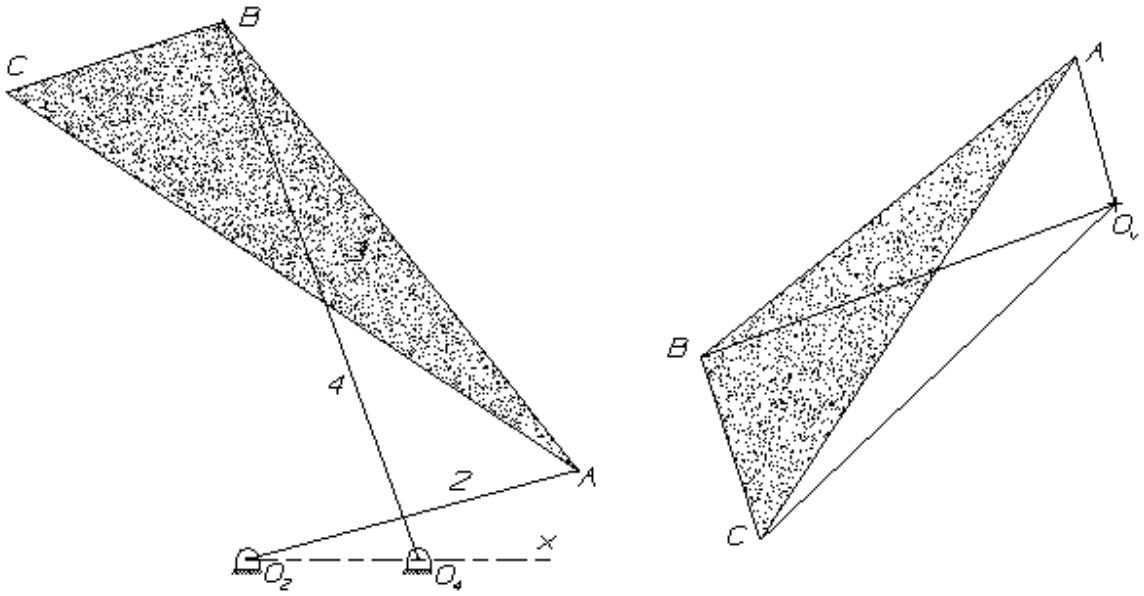

$$\mathbf{V}_B = \overset{\surd\surd}{\mathbf{V}}_A + \overset{?\surd}{\mathbf{V}}_{BA} = \cancel{\mathbf{V}}_{O_4} + \overset{?\surd}{\mathbf{V}}_{BO_4}$$

$$\omega_3 = \frac{V_{BA}}{R_{BA}} = \frac{25.9 \text{ in/s}}{8.0 \text{ in}} = 3.23 \text{ rad/s ccw} \qquad \underline{\textit{Ans.}}$$

$$\mathbf{V}_B = 202.8 \text{ in/s} \angle -56.3° \qquad \underline{\textit{Ans.}}$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.20 For the four-bar linkage in the posture illustrated, the angular velocity of the input link 2 is 8 rad/s ccw. Find the velocity of point *C* and the angular velocity of link 3.

$R_{AO_2} = 150$ mm, $R_{BA} = R_{BO_4} = 250$ mm, $R_{O_4O_2} = 75$ mm, $R_{CA} = 300$ mm, and $R_{CB} = 100$ mm.

$$V_{AO_2} = \omega_2 R_{AO_2} = (8 \text{ rad/s})(0.150 \text{ m}) = 1.200 \text{ m/s}$$

$$\mathbf{V}_B = \overset{\surd\surd}{\mathbf{V}}_A + \overset{?\surd}{\mathbf{V}}_{BA} = \overset{\times}{\mathbf{V}}_{O_4} + \overset{?\surd}{\mathbf{V}}_{BO_4}$$

$$\mathbf{V}_C = 67.86 \text{ in/s} \angle 154.2° \qquad \underline{\textit{Ans.}}$$

$$\overset{?\surd}{\mathbf{V}}_D = \overset{\surd\surd}{\mathbf{V}}_C + \overset{?\surd}{\mathbf{V}}_{DC}$$

$$\mathbf{V}_D = 21.23 \text{ in/s} \angle 90° \qquad \underline{\textit{Ans.}}$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.23 For the linkage used in a two-cylinder 60° V-engine consisting, in part, of an articulated connecting rod, crank 2 rotates at 2 000 rev/min cw. Find the velocities of points *B, C*, and *D*.

$R_{AO_2} = 2$ in, $R_{BA} = R_{CB} = 6$ in, $R_{CA} = 2$ in, and $R_{DC} = 5$ in.

$$\omega_2 = \frac{2000 \text{ rev/min}\left(2\pi \text{ rad/rev}\right)}{60 \text{ s/min}} = 209.4 \text{ rad/s}$$

$$V_{AO_2} = \omega_2 R_{AO_2}$$

$$= \left(209.4 \text{ rad/s}\right)\left(2.0 \text{ in}\right) = 418.9 \text{ in/s}$$

$$\overset{?\surd}{\mathbf{V}}_B = \overset{\surd\surd}{\mathbf{V}}_A + \overset{?\surd}{\mathbf{V}}_{BA}$$

$$\mathbf{V}_B = 425.9 \text{ in/s} \angle -120° \qquad \underline{\textit{Ans.}}$$

Construct velocity image of link 3:

$$\overset{??}{\mathbf{V}}_C = \overset{\surd\surd}{\mathbf{V}}_A + \overset{?\surd}{\mathbf{V}}_{CA} = \overset{\surd\surd}{\mathbf{V}}_B + \overset{?\surd}{\mathbf{V}}_{CB}$$

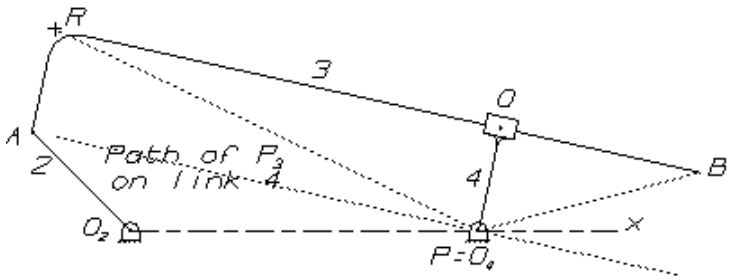

$$\mathbf{V}_C = 486.9 \text{ in/s} \angle -93.3° \qquad \underline{\textit{Ans.}}$$

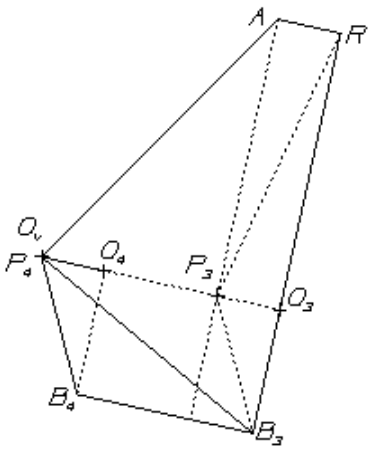

$$\overset{?\surd}{\mathbf{V}}_D = \overset{\surd\surd}{\mathbf{V}}_C + \overset{?\surd}{\mathbf{V}}_{DC}$$

$$\mathbf{V}_D = 378.7 \text{ in/s} \angle -60° \qquad \underline{\textit{Ans.}}$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.24 For the inverted slider-crank linkage in the posture illustrated, the angular velocity of the crank is $\omega_2 = 24$ rad/s cw. Make a complete velocity analysis of the linkage. What is the absolute velocity of point *B*? What is its apparent velocity to an observer moving with link 4?

$$R_{AO_2} = 8 \text{ in} \quad \text{and} \quad R_{O_4O_2} = 20 \text{ in.}$$

$$V_{AO_2} = \omega_2 R_{AO_2} = (24 \text{ rad/s})(8.00 \text{ in}) = 192.0 \text{ in/s}$$

Using the path of P_3 on link 4, we write

$$\mathbf{V}_{P_3} = \overset{\surd\surd}{\mathbf{V}}_A + \overset{?\surd}{\mathbf{V}}_{P_3A} = \cancel{\mathbf{V}}_{P_4} + \overset{?\surd}{\mathbf{V}}_{P_3/4}$$

$$\omega_3 = \frac{V_{P_3A}}{R_{P_3A}} = \frac{161.8 \text{ in/s}}{26.27 \text{ in}} = 6.16 \text{ rad/s cw}$$

From this, or from the velocity image of link 3, we find

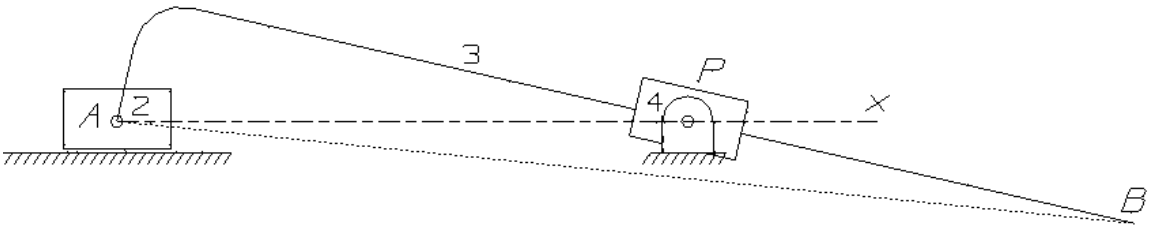

$$\mathbf{V}_{B_3} = 157.8 \text{ in/s} \angle -39.7° \qquad \underline{\textit{Ans.}}$$

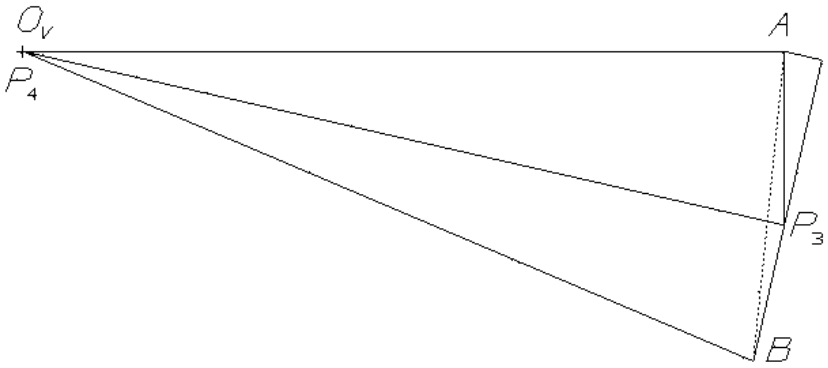

Then, since link 4 remains perpendicular to link 3, we have $\omega_4 = \omega_3$ and we find the velocity image of link 4:

$$\mathbf{V}_{B_3/4} = 103.3 \text{ in/s} \angle -12.4° \qquad \underline{\textit{Ans.}}$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.25 For the linkage in the posture illustrated, the velocity of point A is $1\hat{\mathbf{i}}$ ft/s. Find the velocity of coupler point B.

$V_A = 12$ in/s

Using the path of P_3 on link 4, we write

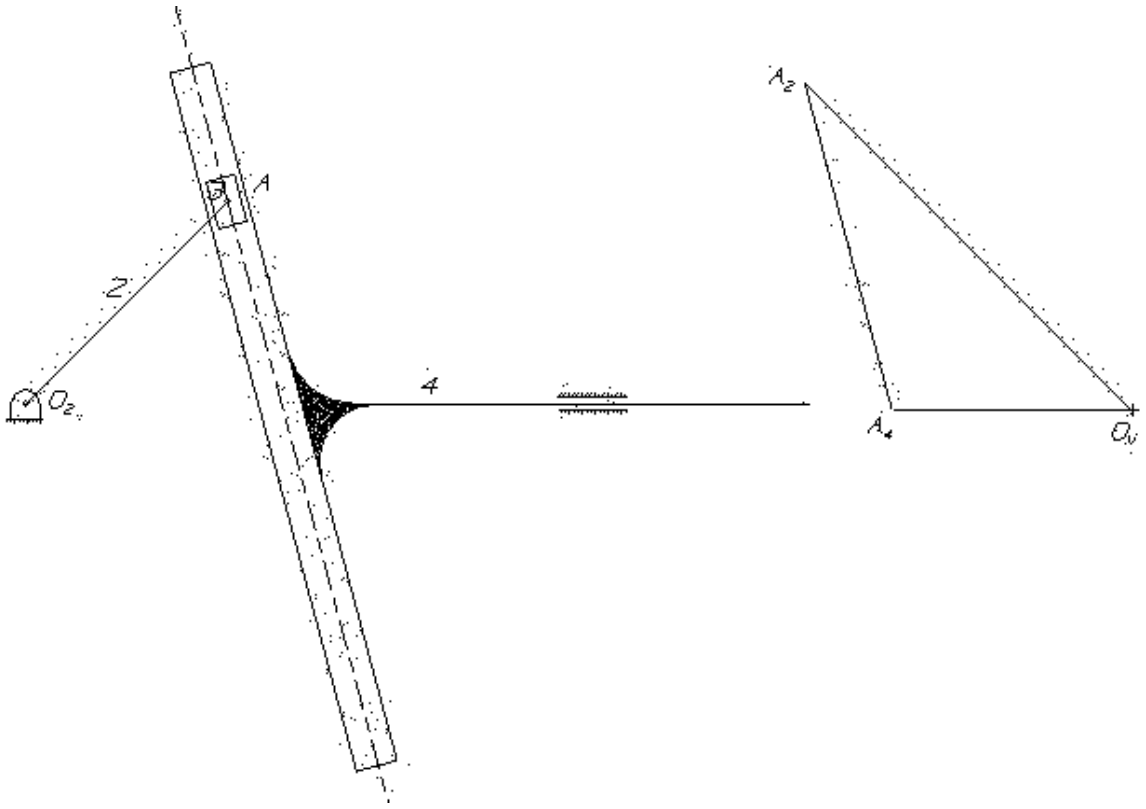

$$\mathbf{V}_{P_3} = \overset{\surd\surd}{\mathbf{V}}_A + \overset{?\surd}{\mathbf{V}}_{P_3A} = \cancel{\mathbf{V}}_{P_4} + \overset{?\surd}{\mathbf{V}}_{P_3/4}$$

Next we construct the velocity image of link 3

$$\mathbf{V}_B = \overset{\surd\surd}{\mathbf{V}}_{P_3} + \overset{?\surd}{\mathbf{V}}_{BP_3} = \overset{\surd\surd}{\mathbf{V}}_A + \overset{?\surd}{\mathbf{V}}_{BA}$$

$\mathbf{V}_B = 12.50 \text{ in/s} \angle -23.0°$ *Ans.*

3.26 A variation of the Scotch-yoke linkage in the posture illustrated, is driven by crank 2 at $\omega_2 = 36$ rad/s ccw. Find the velocity of the crosshead, link 4.

$R_{AO_2} = 250$ mm.

$V_{AO_2} = \omega_2 R_{AO_2} = (36 \text{ rad/s})(0.250 \text{ m}) = 9.0 \text{ m/s}$

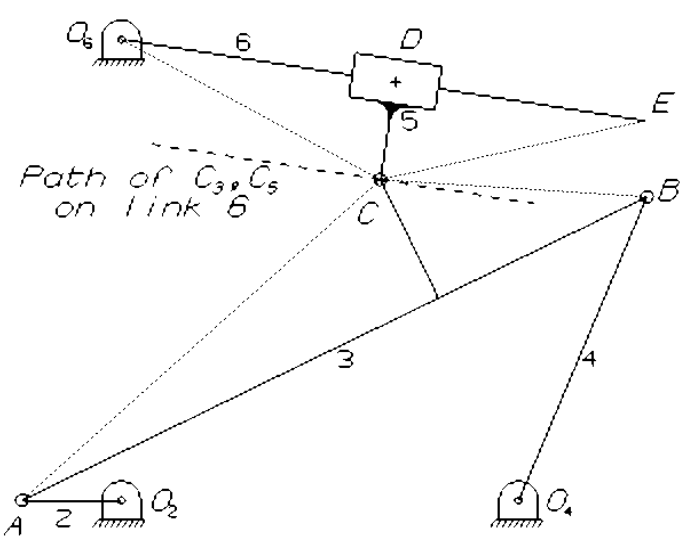

Using the path of A_2 on link 4, we write

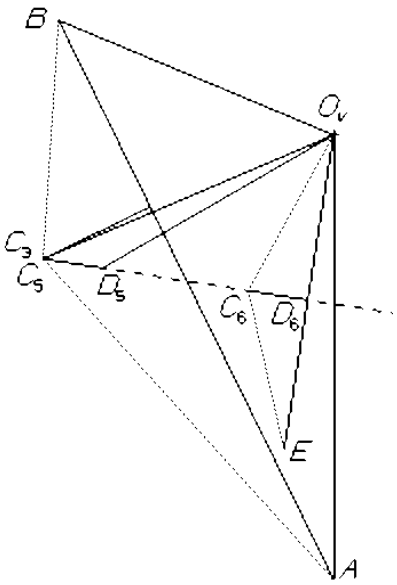

$\mathbf{V}_{A_2}^{\surd\surd} = \mathbf{V}_{A_4}^{?\surd} + \mathbf{V}_{A_2/4}^{?\surd}$ (Note that the path is unknown for $\mathbf{V}_{A_4/2}$!)

$\mathbf{V}_{A_4} = 4.658 \text{ m/s} \angle 180°$ *Ans.*

All other points of link 4 have this same velocity since link 4 is in translation.

3.27 Perform a complete velocity analysis of the modified four-bar linkage for $\omega_2 = 72$ rad/s ccw.

$R_{AO_2} = R_{DC} = 1.5$ in, $R_{BA} = 10.5$ in, $R_{O_4O_2} = 6$ in, $R_{BO_4} = 5$ in, $R_{O_6O_2} = 7$ in, and $R_{EO_6} = 8$ in.

$$V_{AO_2} = \omega_2 R_{AO_2} = (72 \text{ rad/s})(1.50 \text{ in}) = 108.0 \text{ in/s}$$

$$\mathbf{V}_B = \overset{\surd\surd}{\mathbf{V}}_A + \overset{?\surd}{\mathbf{V}}_{BA} = \cancel{\mathbf{V}}_{O_4} + \overset{?\surd}{\mathbf{V}}_{BO_4}$$

Construct the velocity image of link 3

$$\mathbf{V}_C = \overset{\surd\surd}{\mathbf{V}}_A + \overset{?\surd}{\mathbf{V}}_{CA} = \overset{\surd\surd}{\mathbf{V}}_B + \overset{?\surd}{\mathbf{V}}_{CB}$$

$$\mathbf{V}_{C_3} = 76.32 \text{ in/s} \angle 203.2° \qquad \underline{\textit{Ans.}}$$

Using the path of C_3 on link 6, we next write

$$\overset{\surd\surd}{\mathbf{V}}_{C_3} = \mathbf{V}_{C_6} + \overset{?\surd}{\mathbf{V}}_{C_3/6} \quad \text{and} \quad \mathbf{V}_{C_6} = \overset{?\surd}{\mathbf{V}}_{C_6O_6}$$

from which

$$\mathbf{V}_{C_6} = 43.07 \text{ in/s} \angle 241.4° \qquad \underline{\textit{Ans.}}$$

Then we can complete the velocity image of link 6

$$\mathbf{V}_E = 77.39 \text{ in/s} \angle -98.9° \qquad \underline{\textit{Ans.}}$$

Since link 5 remains perpendicular to link 6,

$$\omega_5 = \omega_6 = \frac{V_{C_6O_6}}{R_{C_6O_6}} = 9.67 \text{ rad/s cw} \qquad \underline{\textit{Ans.}}$$

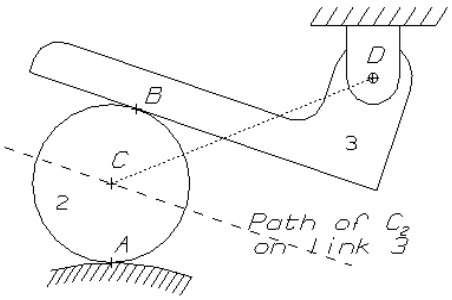

From these we can find

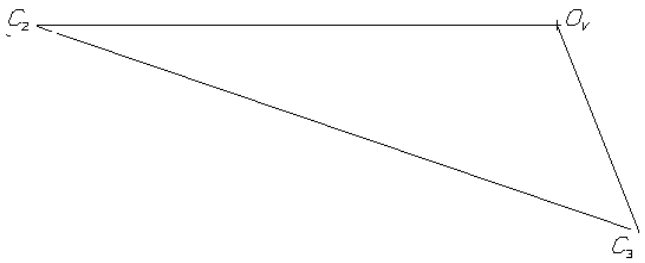

$$V_{DC} = \omega_5 R_{DC} = (9.67 \text{ rad/s})(1.5 \text{ in}) = 14.505 \text{ in/s}$$

$$\overset{??}{\mathbf{V}}_{D_5} = \overset{\surd\surd}{\mathbf{V}}_{C_5} + \overset{\surd\surd}{\mathbf{V}}_{D_5C_5} = 64.49 \text{ in/s} \angle 210.1° \qquad \underline{\textit{Ans.}}$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.28 For the mechanism in the posture illustrated, the velocity of point C is V_C = 10 in/s to the left. There is rolling contact between links 1 and 2, but slip is possible between links 2 and 3. Determine the angular velocity of link 3.

$$\rho_1 = 6 \text{ in}, \quad \rho_2 = 0.75 \text{ in}, \quad \mathbf{R}_{AD} = -2.5\hat{\mathbf{i}} - 1.75\hat{\mathbf{j}} \text{ in}, \text{ and } R_{ED} = 1 \text{ in}.$$

(Note that the path of C_3 on link 2 for $\mathbf{V}_{C_3/2}$ is unknown!)

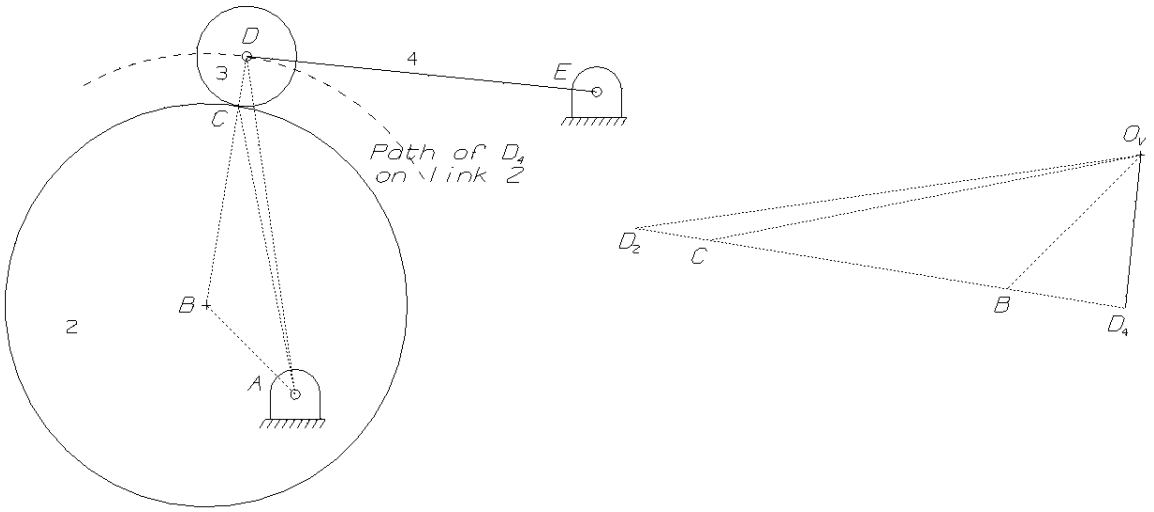

Using the path of C_2 on link 3, we write

$$\overset{\surd\surd}{\mathbf{V}}_{C_2} = \overset{??}{\mathbf{V}}_{C_3} + \overset{?\surd}{\mathbf{V}}_{C_2/3} \quad \text{and} \quad \overset{??}{\mathbf{V}}_{C_3} = \cancel{\mathbf{V}}_{D_3} + \overset{?\surd}{\mathbf{V}}_{C_3D_3}$$

$$\omega_3 = \frac{V_{C_3D_3}}{R_{C_3D_3}} = \frac{4.226 \text{ in/s}}{2.69 \text{ in}} = 1.569 \text{ rad/s ccw} \qquad \underline{\textit{Ans.}}$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.29 For the circular cam in the posture illustrated, the angular velocity of the cam is $\omega_2 = 15$ rad/s ccw. There is rolling contact between the cam and the roller, link 3. Find the angular velocity of the oscillating follower, link 4.

$$V_B = V_{BA} = \omega_2 R_{BA} = (15 \text{ rad/s})(1.25 \text{ in}) = 18.75 \text{ in/s}$$

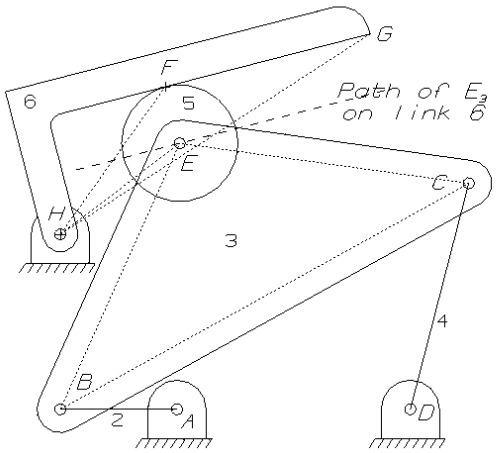

Construct the velocity image of link 2.

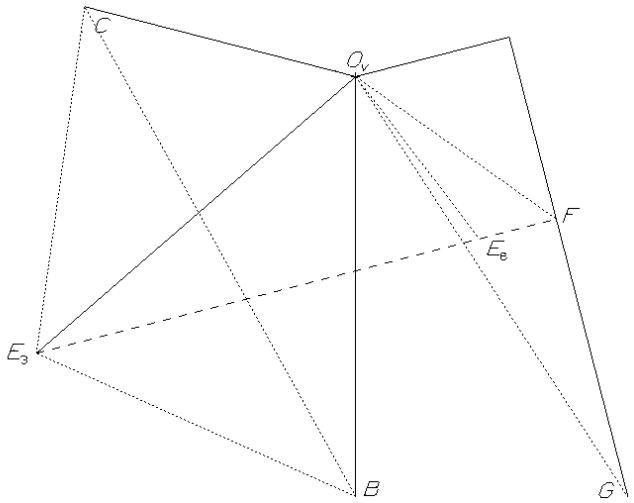

$$\mathbf{V}_{D_4} = \overset{\surd\surd}{\mathbf{V}}_{D_2} + \overset{?\surd}{\mathbf{V}}_{D_4/2} = \cancel{\mathbf{V}}_E + \overset{?\surd}{\mathbf{V}}_{D_4E}$$

$$\omega_4 = \frac{V_{D_4E}}{R_{D_4E}} = \frac{15.24 \text{ in/s}}{3.500 \text{ in}} = 4.355 \text{ rad/s ccw} \qquad \underline{\textit{Ans.}}$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.30 The mechanism in the posture illustrated is driven by link 2 at 10 rad/s ccw. There is rolling contact at point *F*. Determine the velocities of points *E* and *G* and the angular velocities of links 3, 4, 5, and 6.

$$V_{BA} = \omega_2 R_{BA} = (10 \text{ rad/s})(1.000 \text{ in}) = 10.00 \text{ in/s}$$

$$\mathbf{V}_C = \overset{\surd\surd}{\mathbf{V}}_B + \overset{?\surd}{\mathbf{V}}_{CB} = \cancel{\mathbf{V}}_D + \overset{?\surd}{\mathbf{V}}_{CD}$$

Construct velocity image of link 3:

$$\mathbf{V}_{E_3} = \overset{\surd\surd}{\mathbf{V}}_B + \overset{?\surd}{\mathbf{V}}_{E_3B} = \overset{\surd\surd}{\mathbf{V}}_C + \overset{?\surd}{\mathbf{V}}_{E_3C}$$

$$\mathbf{V}_{E_3} = 10.06 \text{ in/s} \angle 220.9° \qquad \underline{\textit{Ans.}}$$

Using the path of E_3 on link 6,

$$\overset{\surd\surd}{\mathbf{V}}_{E_3} = \overset{??}{\mathbf{V}}_{E_6} + \overset{?\surd}{\mathbf{V}}_{E_3/6} \quad \text{and} \quad \overset{??}{\mathbf{V}}_{E_6} = \cancel{\mathbf{V}}_H + \overset{?\surd}{\mathbf{V}}_{E_6H}$$

Construct velocity image of link 6:

$$\mathbf{V}_G = \overset{\surd\surd}{\mathbf{V}}_{E_6} + \overset{?\surd}{\mathbf{V}}_{GE_6} = \cancel{\mathbf{V}}_H + \overset{?\surd}{\mathbf{V}}_{GH}$$

$$\mathbf{V}_G = 11.93 \text{ in/s} \angle -57.1° \qquad \underline{\textit{Ans.}}$$

$$\omega_3 = \frac{V_{CB}}{R_{CB}} = \frac{13.33 \text{ in/s}}{4.000 \text{ in}} = 3.333 \text{ rad/s ccw} \qquad \underline{\textit{Ans.}}$$

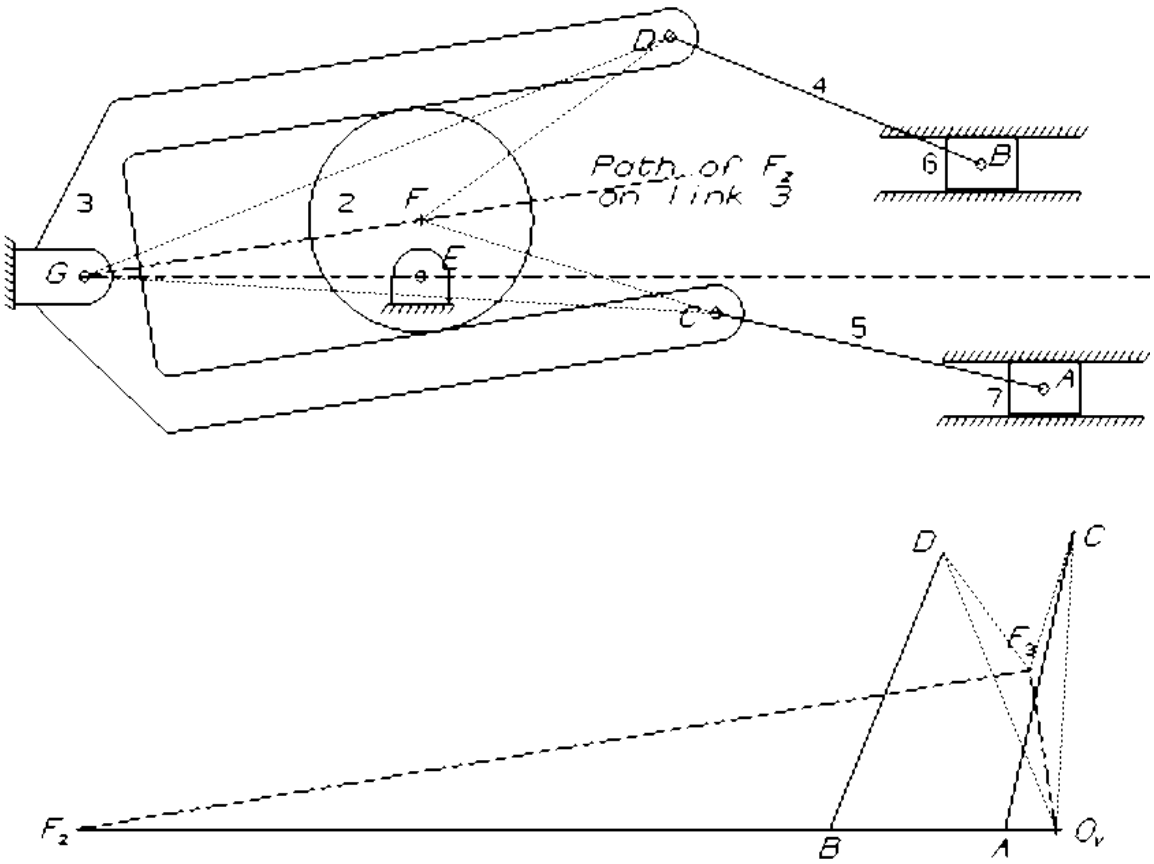

$$\omega_4 = \frac{V_{CD}}{R_{CD}} = \frac{6.667 \text{ in/s}}{2.000 \text{ in}} = 3.333 \text{ rad/s ccw} \qquad \underline{\textit{Ans.}}$$

$$\omega_5 = \frac{V_{F_5E}}{R_{F_5E}} = \frac{12.78 \text{ in/s}}{0.500 \text{ in}} = 25.56 \text{ rad/s cw} \qquad \underline{\textit{Ans.}}$$

$$\omega_6 = \frac{V_{E_6H}}{R_{E_6H}} = \frac{4.858 \text{ in/s}}{1.288 \text{ in}} = 3.774 \text{ rad/s cw} \qquad \underline{\textit{Ans.}}$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.31 The two-piston pump, in the posture illustrated, is driven by a circular eccentric, link 2, at $\omega_2 = 25$ rad/s ccw. Find the velocities of the two pistons, links 6 and 7.

$V_{F_2} = V_{F_2E} = \omega_2 R_{FE} = (25 \text{ rad/s})(1.0 \text{ in}) = 25.00 \text{ in/s}$

Using the path of F_2 on link 3, we write

$\overset{\surd\surd}{\mathbf{V}}_{F_2} = \overset{??}{\mathbf{V}}_{F_3} + \overset{?\surd}{\mathbf{V}}_{F_2/3}$ and $\mathbf{V}_{F_3} = \cancel{\mathbf{V}}_G + \overset{?\surd}{\mathbf{V}}_{F_3G}$

Construct velocity image of link 3:

$\mathbf{V}_C = \overset{\surd\surd}{\mathbf{V}}_{F_3} + \overset{?\surd}{\mathbf{V}}_{CF_3} = \cancel{\mathbf{V}}_G + \overset{?\surd}{\mathbf{V}}_{CG}$

$\mathbf{V}_D = \overset{\surd\surd}{\mathbf{V}}_{F_3} + \overset{?\surd}{\mathbf{V}}_{DF_3} = \cancel{\mathbf{V}}_G + \overset{?\surd}{\mathbf{V}}_{DG}$. Then

$\overset{?\surd}{\mathbf{V}}_A = \overset{\surd\surd}{\mathbf{V}}_C + \overset{?\surd}{\mathbf{V}}_{AC}$

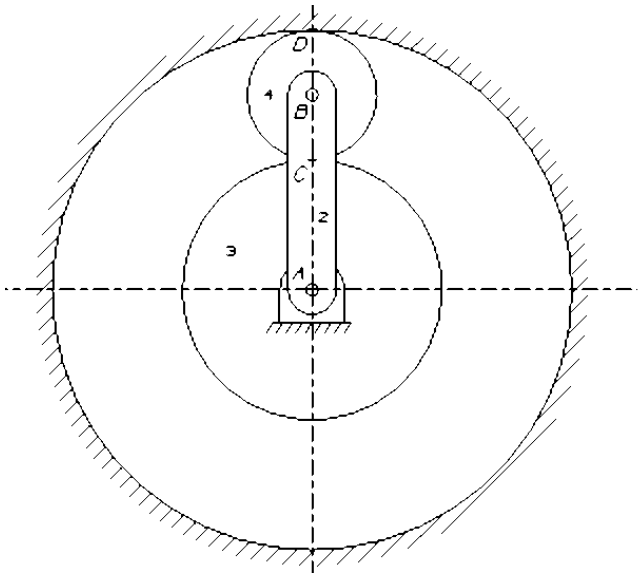

$\mathbf{V}_A = 1.302 \text{ in/s} \angle 180°$ *Ans.*

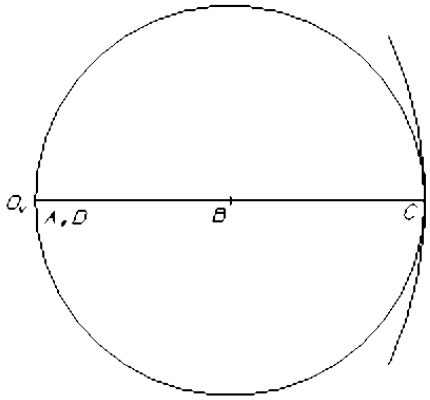

$\overset{?\surd}{\mathbf{V}}_B = \overset{\surd\surd}{\mathbf{V}}_D + \overset{?\surd}{\mathbf{V}}_{BD}$

$\mathbf{V}_B = 5.777 \text{ in/s} \angle 180°$ *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.32 The epicyclic gear train is driven by the arm, link 2, at $\omega_2 = 10$ rad/s cw. Determine the angular velocity of the output shaft, attached to gear 3.

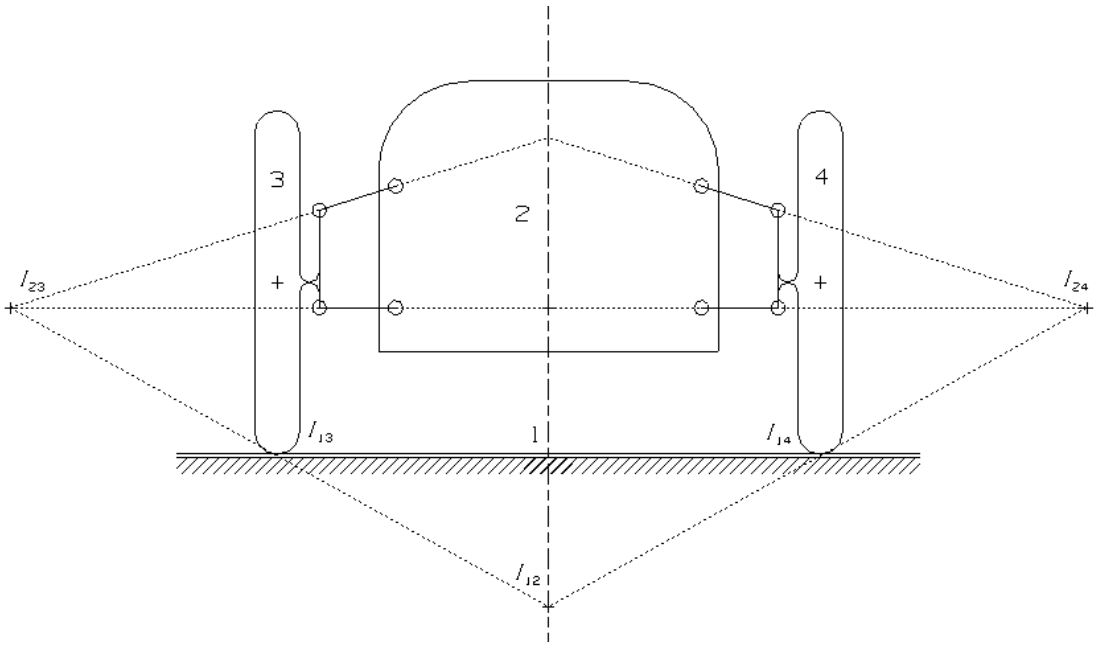

$V_B = V_{BA} = \omega_2 R_{BA} = (10 \text{ rad/s})(3.000 \text{ in}) = 30.00 \text{ in/s}$

Using $\mathbf{V}_{D_4} = 0$ construct the velocity image of link 4.

$\mathbf{V}_C = 60 \text{ in/s} \angle 0°$.

$$\omega_3 = \frac{V_{CA}}{R_{CA}} = \frac{60.00 \text{ in/s}}{2.000 \text{ in}} = 30.00 \text{ rad/s cw}$$ *Ans.*

3.33 The diagram illustrates a planar schematic approximation of an automotive front suspension. The roll center is the term used by the industry to describe the point about which the auto body seems to rotate (roll) with respect to the ground. The assumption is made that there is pivoting but no slip between the tires and the road. After making a sketch, use the concepts of instant centers to find a technique to locate the roll center.

By definition, the "roll center" (of the vehicle body, link 2, with respect to the road, link 1,) is the instantaneous center I_{12}. It can be found by the repeated application of Kennedy's theorem as shown.

In the automotive industry it has become common practice to use only half of this graphic construction, assuming, by symmetry, that I_{12} must lie on the vertical centerline of the vehicle. Note that this is true only when the right and left suspension arms are symmetrically positioned. It is not true once the vehicle begins to roll, as in a turn.

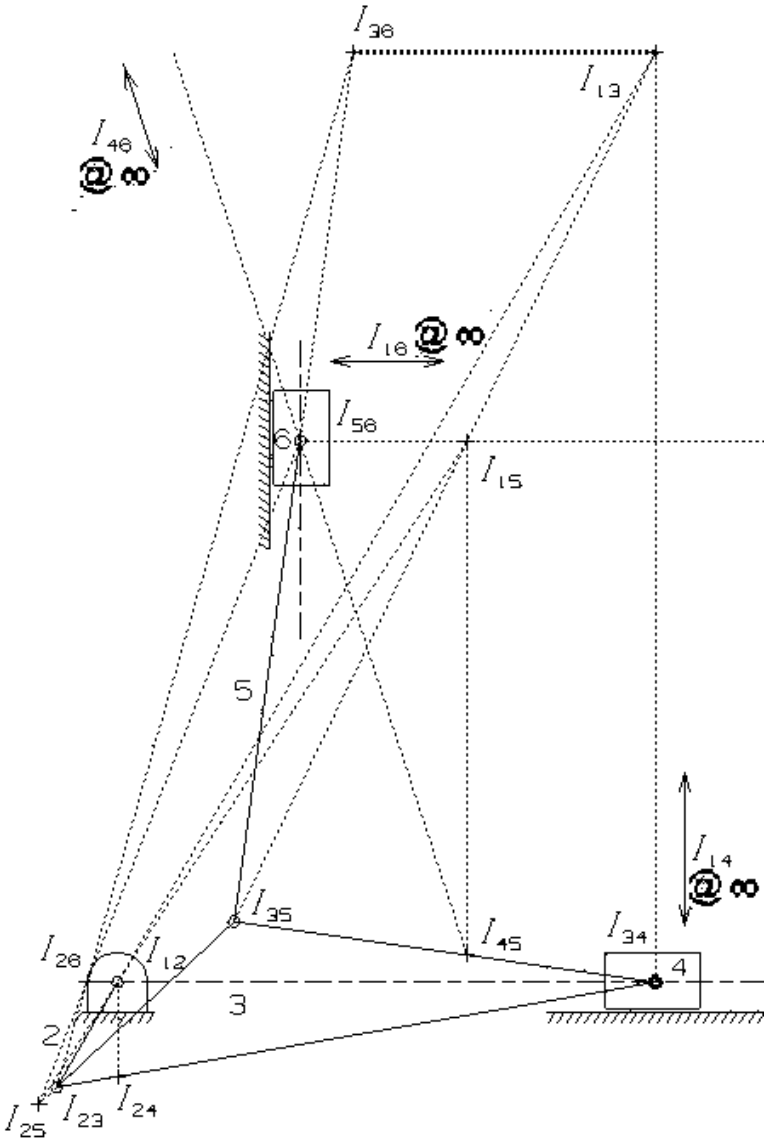

Having lost sight of the relationship to instantaneous centers and Kennedy's theorem, and remembering only the shortened graphic construction on one side of the vehicle, many in the industry are now confused and believe that the movement of the roll center, as roll progresses, is vertical, along the centerline of the vehicle (sometimes called the "jacking coefficient"!). They should be thinking about the fixed and moving centrodes (Sec. 3.21), which are more horizontal than vertical!

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

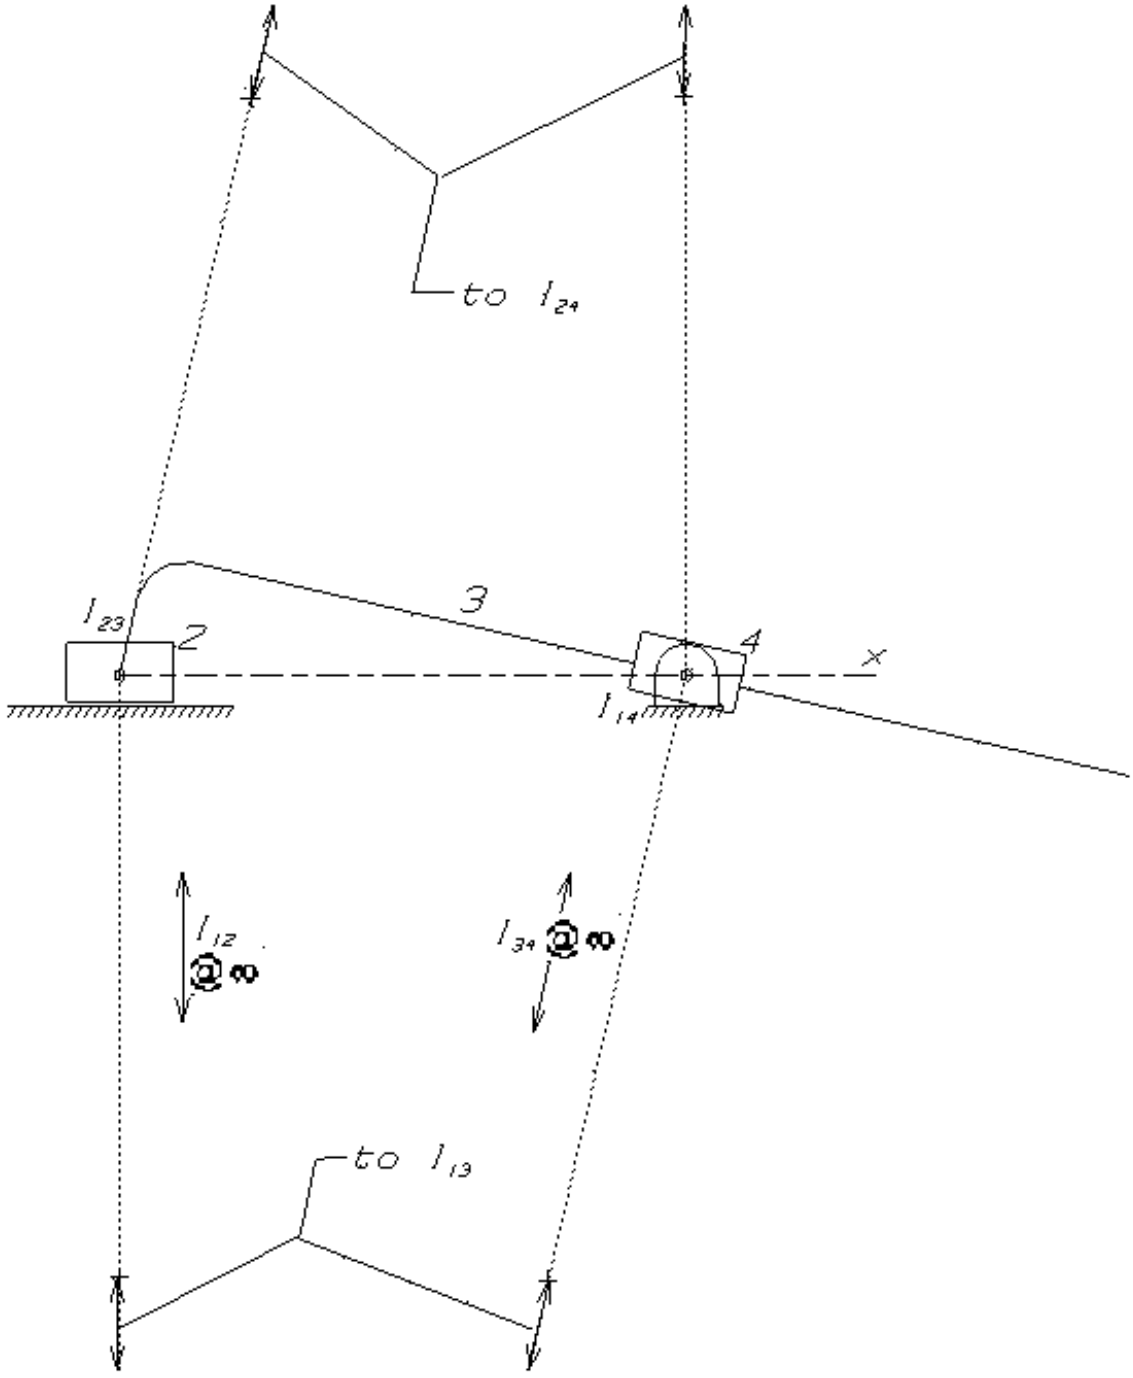

3.34 Locate all instant centers for the linkage of Problem 3.22.

Primary instant centers I_{12}, I_{23}, I_{34}, I_{14} (at infinity), I_{35}, I_{56}, and I_{16} (at infinity) are found by inspection. All others are found by repeated applications of Kennedy's theorem except I_{46}.

One line can be found by Kennedy's theorem for l_{46}; however, no second line can be found by Kennedy's theorem since no line can be drawn (in finite space) between I_{14} and I_{16}. However, we can see that I_{46} must be infinitely remote because the relative motion between links 4 and 6 is translation; that is, the angle between lines on links 4 and 6 remains constant.

3.35 Locate all instant centers for the mechanism of Problem 3.25.

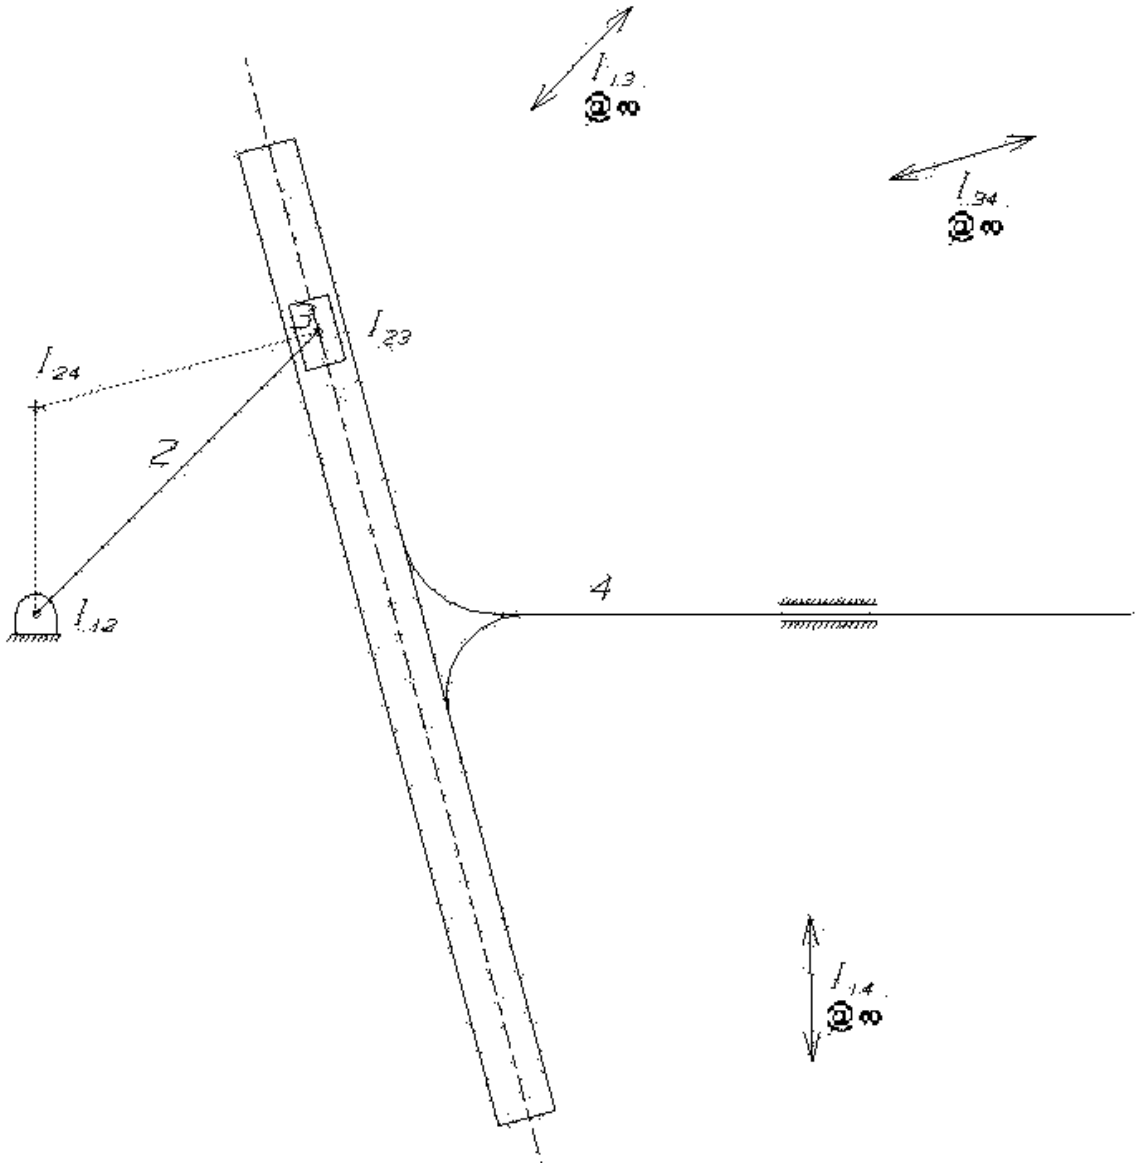

Primary instant centers I_{12} (at infinity), I_{23}, I_{34} (at infinity), and I_{14} are found by inspection. All others are found by repeated applications of Kennedy's theorem.

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.36 Locate all instant centers for the mechanism of Problem 3.26.

Primary instant centers I_{12}, I_{23}, I_{34} (at infinity), and I_{14} (at infinity) are found by inspection. All others are found by repeated applications of Kennedy's theorem except I_{13}.

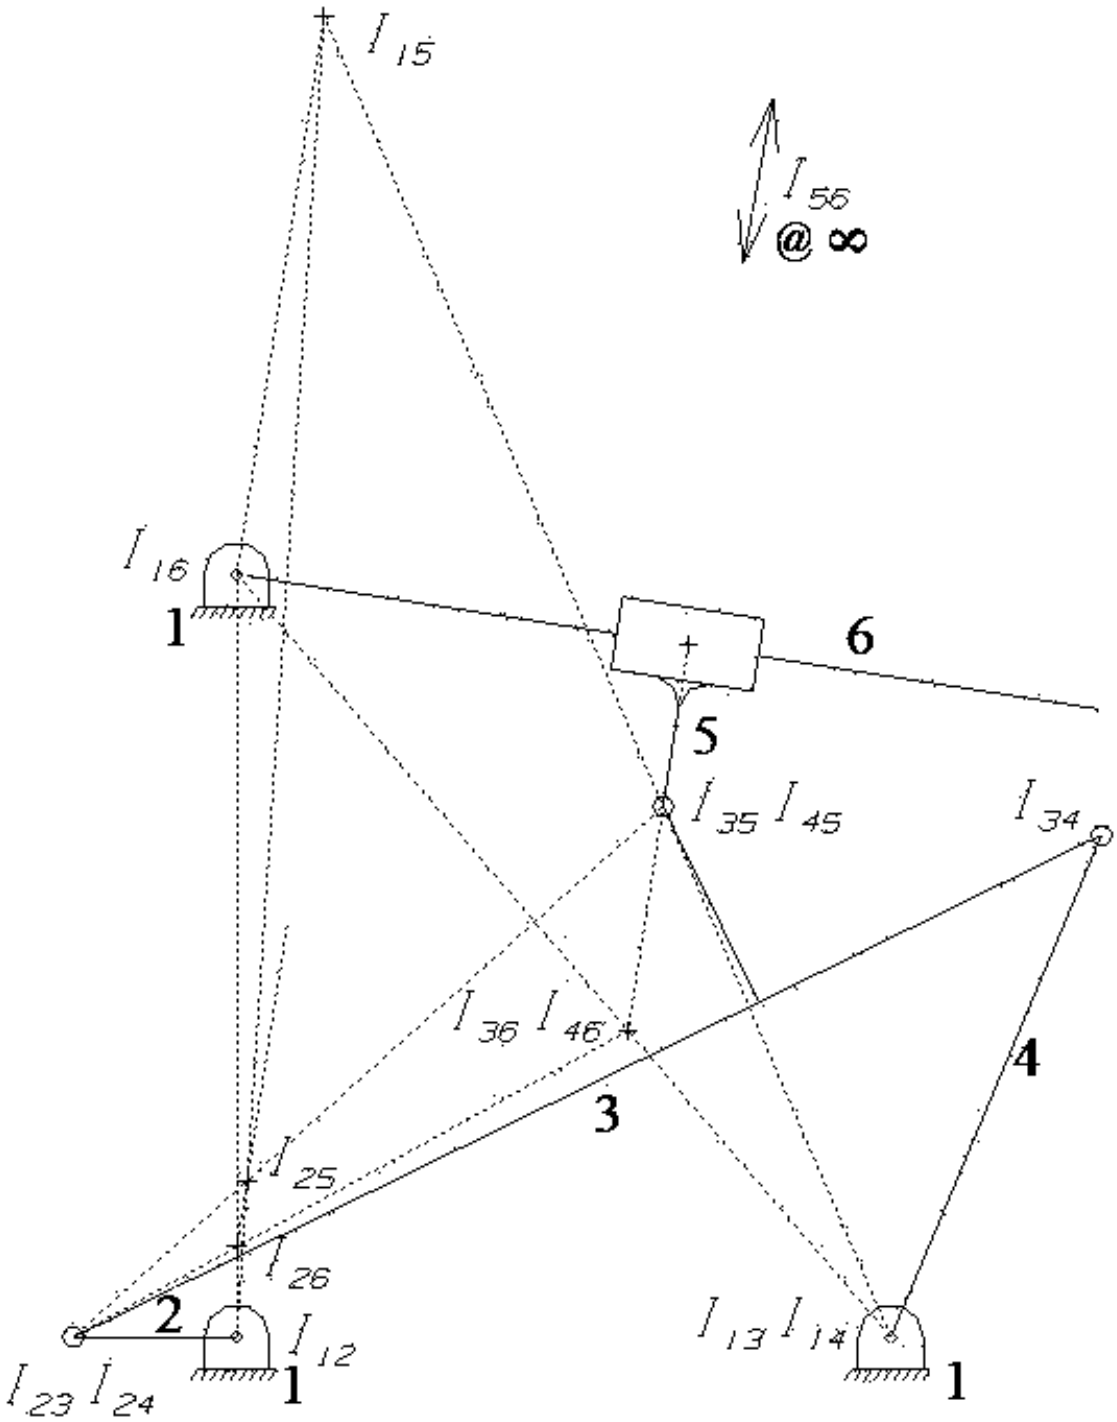

One line ($\overline{I_{12}\,I_{23}}$) can be found for I_{13}; however, no second line can be found by Kennedy's theorem since no line can be drawn (in finite space) between I_{14} and I_{34}. However, it may be seen that I_{13} must be infinitely remote because the relative motion between links 1 and 3 is translation; that is, the angle between links 1 and 3 is constant.

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

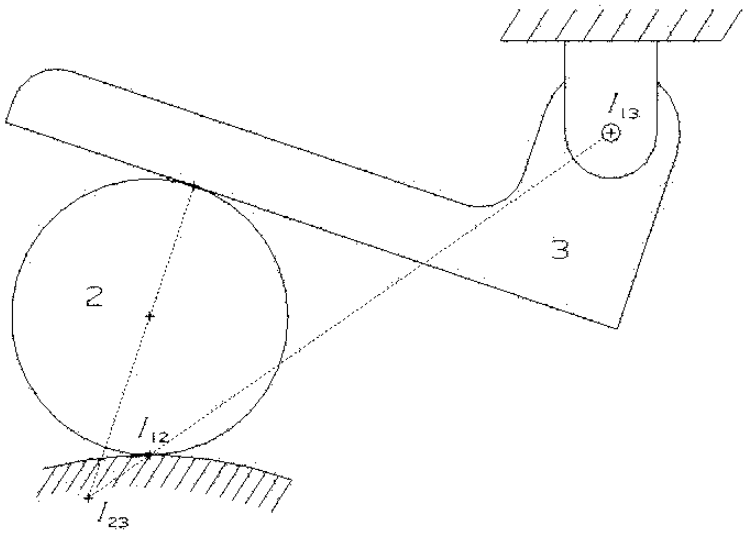

3.37 Locate all instant centers for the mechanism of Problem 3.27.

Primary instant centers I_{12}, I_{23}, I_{34}, I_{14}, I_{35}, I_{56} (at infinity), and I_{16} are found by inspection. All others are found by repeated applications of Kennedy's theorem.

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.38 Locate all instant centers for the mechanism of Problem 3.28.

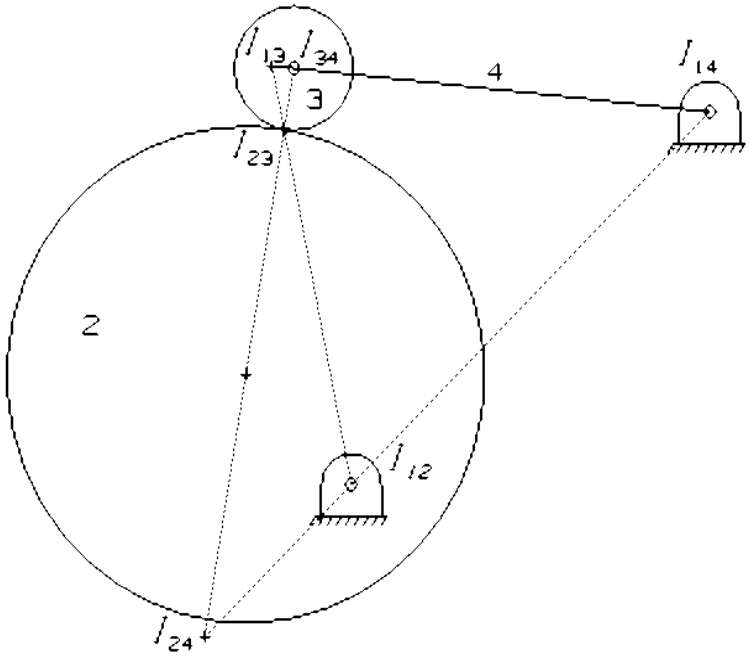

Primary instant centers I_{12} and I_{13} are found by inspection.

One line for I_{23} is found by Kennedy's theorem. The other is found on the perpendicular to the relative velocity of slipping at the point of contact between links 2 and 3.

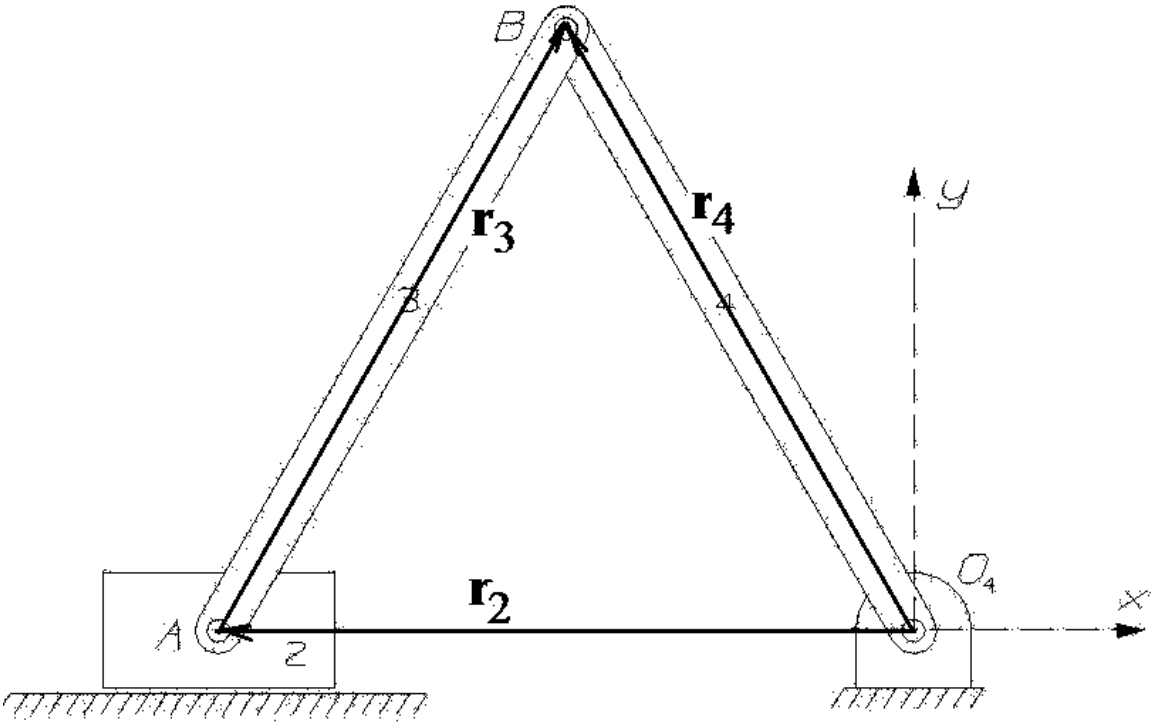

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.39 Locate all instant centers for the mechanism of Problem 3.29.

Primary instant centers I_{12}, I_{23}, I_{34}, and I_{14} are found by inspection. The other two are found by Kennedy's theorem.

3.40 The posture of the input link 2 is $\mathbf{R}_{AO_4} = -120\hat{\mathbf{i}}$ mm and the velocity of point A is $\mathbf{V}_A = 15\hat{\mathbf{i}}$ m/s. Determine the first-order kinematic coefficients for the mechanism. Find the angular velocities of links 3 and 4.

$$R_{BO_4} = R_{BA} = 120 \text{ mm}$$

The loop-closure equation is

$$\mathbf{r}_2 + \mathbf{r}_3 - \mathbf{r}_4 = \mathbf{0}.$$

The two scalar position equations are

$$-r_2 + r_3\cos\theta_3 - r_4\cos\theta_4 = 0$$
$$r_3\sin\theta_3 - r_4\sin\theta_4 = 0$$

With the given data, at the position $r_2 = 120$ mm, the solution is $\theta_3 = 60°$ and $\theta_4 = 120°$.

Taking the derivative of the position equations with respect to input r_2 gives

$$-1 - r_3\sin\theta_3\theta_3' + r_4\sin\theta_4\theta_4' = 0$$
$$r_3\cos\theta_3\theta_3' - r_4\cos\theta_4\theta_4' = 0$$

or, in matrix format, $\begin{bmatrix} r_3\sin\theta_3 & -r_4\sin\theta_4 \\ r_3\cos\theta_3 & -r_4\cos\theta_4 \end{bmatrix}\begin{bmatrix} \theta_3' \\ \theta_4' \end{bmatrix} = \begin{bmatrix} -1 \\ 0 \end{bmatrix}$

The determinant of the Jacobian is $\Delta = r_3 r_4 \sin(\theta_4 - \theta_3)$ and goes to zero when $\theta_3 = \theta_4$ or when $\theta_3 = \theta_4 \pm 180°$.

The solutions for the first-order kinematic coefficients are

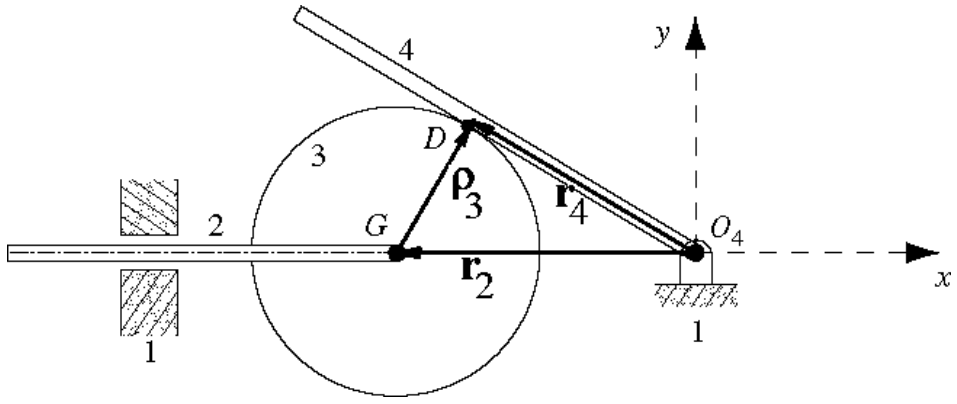

$r_2' = 1$ m/m, $\theta_3' = r_4\cos\theta_4/\Delta = -4.811$ rad/m, and $\theta_4' = r_3\cos\theta_3/\Delta = 4.811$ rad/m. *Ans.*

The input velocity is given as $\dot{r}_2 = -15.0$ m/s.

$\omega_3 = \theta_3'\dot{r}_2 = 72.17$ rad/s (ccw) and $\omega_4 = \theta_4'\dot{r}_2 = -72.17$ rad/s (cw) *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.41 For the rack-and-pinion mechanism in the posture illustrated, link 2 is the input and pinion 3 is rolling without slipping on rack 4 at point *D*. Determine the first-order kinematic coefficients of the links 3 and 4. If the constant input velocity is $\mathbf{V}_G = 3\hat{\mathbf{i}}$ in/s, determine the angular velocities of rack 4 and pinion 3.

$R_{GO_4} = 10$ in, and $R_{DG} = \rho_3 = 5$ in.

The loop-closure equation is $\mathbf{r}_2 + \boldsymbol{\rho}_3 - \mathbf{r}_4 = \mathbf{0}$ with the constraint $\theta_3 = \theta_4 - 90°$. The two scalar position equations are

$$r_2 + \rho_3 \sin\theta_4 - \cos\theta_4 r_4 = 0$$
$$-\rho_3 \cos\theta_4 - \sin\theta_4 r_4 = 0$$

At the position $r_2 = -10$ in, the solution is $\theta_4 = 150°$ and $r_4 = -\rho_3/\tan\theta_4 = 8.660$ in.

Taking the derivative of the position equations with respect to input r_2 gives

$$1 + \rho_3 \cos\theta_4\theta_4' + \sin\theta_4 r_4\theta_4' - \cos\theta_4 r_4' = 0$$
$$\rho_3 \sin\theta_4\theta_4' - \cos\theta_4 r_4\theta_4' - \sin\theta_4 r_4' = 0$$

or, simplifying by use of the position equations and putting into matrix format,

$$\begin{bmatrix} 0 & \cos\theta_4 \\ r_2 & \sin\theta_4 \end{bmatrix} \begin{bmatrix} \theta_4' \\ r_4' \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$

The determinant of the Jacobian is $\Delta = -r_2 \cos\theta_4$ and goes to zero when $\theta_4 = \pm 90°$ or $r_2 = 0$.

The solutions for the first-order kinematic coefficients are

$\theta_4' = \sin\theta_4/\Delta = -0.057\,7$ rad/in and $r_4' = -r_2/\Delta = -1.154\,7$ in/in *Ans.*

The input velocity is given as $\dot{r}_2 = +3.0$ in/s. From this we can get

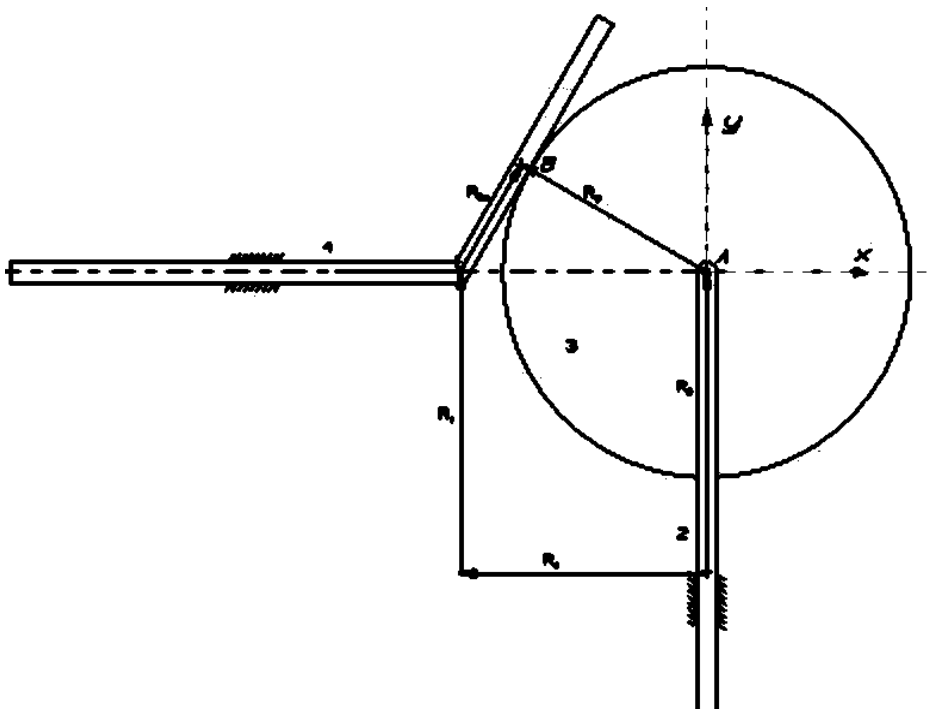

$\omega_4 = \theta_4'\dot{r}_2 = -0.173\,2$ rad/s (cw) *Ans.*

However, we must notice that vector $\boldsymbol{\rho}_3$ is not attached to link 3. To find ω_3 we start with the constraint for rolling with no slip. If we designate rotation of link 3 by the angle θ_3 then $\rho_3(\Delta\theta_3 - \Delta\theta_4) = -\Delta r_4$. Dividing this by Δt and taking the limit, we get the angular velocity of the pinion, link 3

$$\omega_3 = \dot{\theta}_3 = \omega_4 - \dot{r}_4/\rho_3 = 0.519\,6 \text{ rad/s (ccw)} \quad \textit{Ans.}$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.42 For the rack-and-pinion mechanism of Example 2.8, (Figures 2.33 and 2.34), the dimensions are $R_1 = 800$ mm, $R_9 = 550$ mm, $\theta_{34} = 60°$, and $\rho_3 = 500$ mm. In the posture where $R_2 = 750$ mm, the input link 2 has a velocity of $\mathbf{V}_A = 0.150\hat{\mathbf{j}}$ m/s. Determine the first-order kinematic coefficients to obtain the velocity of the rack 4 and the angular velocity of pinion 3.

Using the vectors defined in Example 2.8, the complex algebra loop-closure equation is

$$jR_2 + jR_9 e^{j\theta_{34}} - R_{34} e^{j\theta_{34}} - jR_1 - R_4 e^{j\pi} = 0$$

and the two scalar position equations are

$$-R_9 \sin\theta_{34} - R_{34}\cos\theta_{34} + R_4 = 0$$

$$R_2 + R_9\cos\theta_{34} - R_{34}\sin\theta_{34} - R_1 = 0$$

At $R_2 = 750$ mm with the given dimensions these give $R_{34} = 259.8$ mm and $R_4 = 606.2$ mm with the no-slip condition that $\Delta R_{34} = \rho_3 \Delta\theta_3$.

Taking the derivative of the position equations with respect to input R_2 gives

$$-\cos\theta_{34} R'_{34} + R'_4 = 0$$

$$1 - \sin\theta_{34} R'_{34} = 0$$

with the condition that $R'_{34} = \rho_3 \theta'_3$.

From these, the first-order kinematic coefficients are

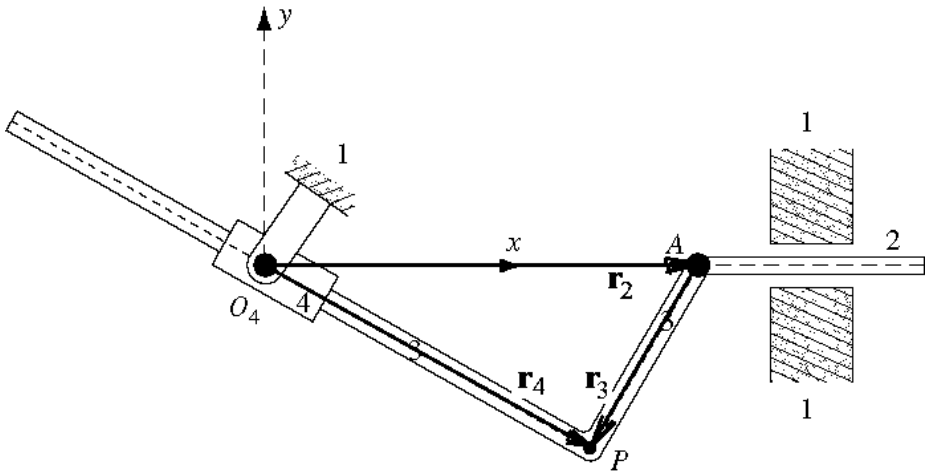

$R'_{34} = 1.154\,7$ m/m, $\theta'_3 = 2.309\,4$ rad/m, and $R'_4 = 0.577\,35$ m/m *Ans.*

The velocity of the rack is $\mathbf{V}_4 = -R'_4 \dot{R}_2 \hat{\mathbf{i}} = -0.086\,6\hat{\mathbf{i}}$ m/s *Ans.*

The angular velocity of the pinion is $\omega_3 = \theta'_3 \dot{R}_2 = 0.346\,4$ rad/s ccw. *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.43 For the mechanism in the posture illustrated, $R_{AO_4} = 10$ in and the input velocity is $\mathbf{V}_A = -5\hat{\mathbf{i}}$ in/s. Determine the first-order kinematic coefficients to obtain the angular velocity of link 3 and the slipping velocity between links 3 and 4.

$R_{PA} = 5$ in and $\angle APO_4 = 90°$.

Let the following vectors be defined as $\mathbf{R}_{AO_4} = r_2 e^{j0}$, $\mathbf{R}_{PA} = r_3 e^{j\theta_3}$, $\mathbf{R}_{PO_4} = jr_4 e^{j\theta_3}$. Then the loop-closure equation is

$$r_2 + r_3 e^{j\theta_3} - jr_4 e^{j\theta_3} = 0$$

The two scalar equations are

$$r_2 + r_3 \cos\theta_3 + r_4 \sin\theta_3 = 0$$
$$r_3 \sin\theta_3 - r_4 \cos\theta_3 = 0$$

which, at the input position $r_2 = 10$ in, has the solution $\theta_3 = \cos^{-1}(-r_3/r_2) = 240°$ and $r_4 = r_3 \tan\theta_3 = 8.660$ in.

Taking the derivative of the position equations with respect to input r_2 gives

$$1 - r_3 \sin\theta_3\theta_3' + r_4 \cos\theta_3\theta_3' + \sin\theta_3 r_4' = 0$$
$$r_3 \cos\theta_3\theta_3' + r_4 \sin\theta_3\theta_3' - \cos\theta_3 r_4' = 0$$

or, simplifying by use of the position equations and putting into matrix format,

$$\begin{bmatrix} 0 & \sin\theta_3 \\ -r_2 & -\cos\theta_3 \end{bmatrix} \begin{bmatrix} \theta_3' \\ r_4' \end{bmatrix} = \begin{bmatrix} -1 \\ 0 \end{bmatrix}$$

The determinant of the Jacobian is $\Delta = r_2 \sin\theta_3$ and goes to zero when $\theta_3 = 0$ at $r_2 = 5$ in.

From the solution of these equations, the first-order kinematic coefficients are

$\theta_3' = \cos\theta_3/\Delta = 0.057\,7$ rad/in and $r_4' = -r_2/\Delta = 1.154\,7$ in/in *Ans.*

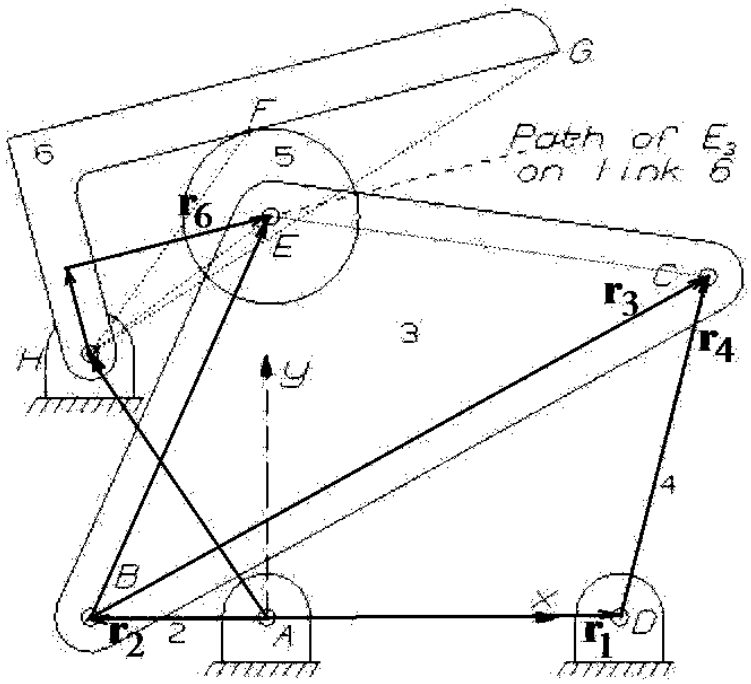

For the given input velocity of $\dot{r}_2 = -5.0$ in/s,

the angular velocity of link 3 is $\omega_3 = \dot{\theta}_3 = \theta_3'\dot{r}_2 = -0.289$ rad/s (cw) *Ans.*

and the slipping velocity is $V_{3/4} = \dot{r}_4 = r_4'\dot{r}_2 = -5.774$ in/s. *Ans.*

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.44 For the mechanism in the posture illustrated in Figure P3.30, the input crank 2 has an angular velocity $\omega_2 = 10$ rad/s ccw and there is rolling contact between links 5 and 6 at point *F*. Determine the first-order kinematic coefficients of links 3, 4, 5, and 6. Find the angular velocities of links 3, 4, 5, and 6 and the velocities of points *E* and *G*.

Let the following vectors be defined: $\mathbf{R}_{BA} = r_2 e^{j\theta_2}$, $\mathbf{R}_{CB} = r_3 e^{j\theta_3}$, $\mathbf{R}_{DA} = r_1 e^{j0}$, $\mathbf{R}_{CD} = r_4 e^{j\theta_4}$, $\mathbf{R}_{EB} = ½r_3 e^{j\theta_3} + j1.5 e^{j\theta_3}$ in, $\mathbf{R}_{HA} = -1.0 + j1.5$ in, and $\mathbf{R}_{EH} = j0.5 e^{j\theta_6} + r_6 e^{j\theta_6}$. Then there are two loop-closure equations

$$\mathbf{R}_{BA} + \mathbf{R}_{CB} - \mathbf{R}_{CD} - \mathbf{R}_{DA} = \mathbf{0}$$

$$\mathbf{R}_{BA} + \mathbf{R}_{EB} - \mathbf{R}_{EH} - \mathbf{R}_{HA} = \mathbf{0}$$

and four corresponding scalar equations

$$r_2 \cos\theta_2 + r_3 \cos\theta_3 - r_4 \cos\theta_4 - r_1 = 0$$

$$r_2 \sin\theta_2 + r_3 \sin\theta_3 - r_4 \sin\theta_4 = 0$$

$$r_2 \cos\theta_2 + ½r_3 \cos\theta_3 - 1.5\sin\theta_3 + 0.5\sin\theta_6 - r_6 \cos\theta_6 + 1.0 = 0$$

$$r_2 \sin\theta_2 + ½r_3 \sin\theta_3 + 1.5\cos\theta_3 - 0.5\cos\theta_6 - r_6 \sin\theta_6 - 1.5 = 0$$

Numeric solution of these with the dimensions specified at the posture with $\theta_2 = 180°$ gives the current position as $\theta_3 = 28.955°$, $\theta_4 = 75.522°$, $\theta_6 = 14.478°$, $r_6 = 1.186$ in.

Taking derivatives of these four equations with respect to input θ_2 gives

$$-r_2 \sin\theta_2 - r_3 \sin\theta_3\theta_3' + r_4 \sin\theta_4\theta_4' = 0$$

$$r_2 \cos\theta_2 + r_3 \cos\theta_3\theta_3' - r_4 \cos\theta_4\theta_4' = 0$$

$$-r_2 \sin\theta_2 - ½r_3 \sin\theta_3\theta_3' - 1.5\cos\theta_3\theta_3' + 0.5\cos\theta_6\theta_6' + r_6 \sin\theta_6\theta_6' - \cos\theta_6 r_6' = 0$$

$$r_2 \cos\theta_2 + ½r_3 \cos\theta_3\theta_3' - 1.5\sin\theta_3\theta_3' + 0.5\sin\theta_6\theta_6' - r_6 \cos\theta_6\theta_6' - \sin\theta_6 r_6' = 0$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

Numeric solution gives the solution as $\theta_3' = 0.333\ 34$ rad/rad, $\theta_4' = 0.333\ 34$ rad/rad, $\theta_6' = -0.377\ 51$ rad/rad, and $r_6' = -1.089\ 56$ in/rad.

The no-slip condition gives the displacement constraint $\Delta r_6 = \rho_5 \left(\Delta\theta_5 - \Delta\theta_6 \right)$ from which we find $r_6' = \rho_5 \left(\theta_5' - \theta_6' \right)$, which gives $\theta_5' = \theta_6' + r_6'/\rho_5 = -2.556\ 63$ rad/rad.

Therefore the first-order kinematic coefficients are

$\theta_3' = 0.333\ 3$ rad/rad, $\theta_4' = 0.333\ 3$ rad/rad, $\theta_5' = -2.556\ 6$ rad/rad, $\theta_6' = -0.377\ 5$ rad/rad. *Ans.*

The angular velocities are

$\omega_3 = \theta_3'\omega_2 = 3.333$ rad/s ccw, $\omega_4 = \theta_4'\omega_2 = 3.333$ rad/s ccw, $\omega_5 = \theta_5'\omega_2 = -25.566$ rad/s (cw), and $\omega_6 = \theta_6'\omega_2 = -3.775$ rad/s (cw). *Ans.*

The positions of points *E* and *G* are

$$x_E = r_2 \cos\theta_2 + \tfrac{1}{2} r_3 \cos\theta_3 - 1.5 \sin\theta_3$$
$$y_E = r_2 \sin\theta_2 + \tfrac{1}{2} r_3 \sin\theta_3 + 1.5 \cos\theta_3$$
$$x_G = -1.0 - 1.0 \sin\theta_6 + 3.0 \cos\theta_6$$
$$y_G = 1.5 + 1.0 \cos\theta_6 + 3.0 \sin\theta_6$$

The derivatives of these give the first-order kinematic coefficients

$$x_E' = -r_2 \sin\theta_2 - \tfrac{1}{2} r_3 \sin\theta_3\theta_3' - 1.5 \cos\theta_3\theta_3' = -0.760\ 26 \text{ in/rad}$$
$$y_E' = +r_2 \cos\theta_2 + \tfrac{1}{2} r_3 \cos\theta_3\theta_3' - 1.5 \sin\theta_3\theta_3' = -0.658\ 72 \text{ in/rad}$$
$$x_G' = -1.0 \cos\theta_6\theta_6' - 3.0 \sin\theta_6\theta_6' = 0.648\ 65 \text{ in/rad}$$
$$y_G' = -1.0 \sin\theta_6\theta_6' + 3.0 \cos\theta_6\theta_6' = -1.002\ 19 \text{ in/rad}$$

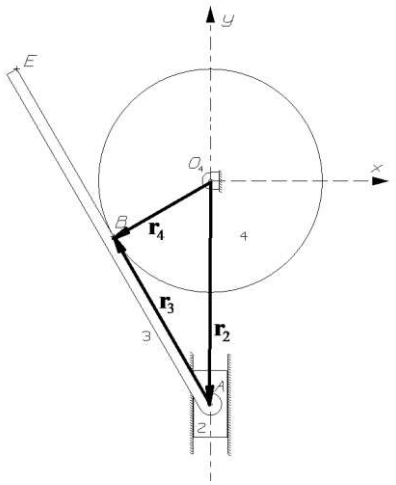

And the velocities are

$$\mathbf{V}_E = x_E'\dot{\theta}_2\hat{\mathbf{i}} + y_E'\dot{\theta}_2\hat{\mathbf{j}} = -7.603\hat{\mathbf{i}} - 6.587\hat{\mathbf{j}} = 10.059 \text{ in/s} \angle -139.09°$$
$$\mathbf{V}_G = x_G'\dot{\theta}_2\hat{\mathbf{i}} + y_G'\dot{\theta}_2\hat{\mathbf{j}} = 6.487\hat{\mathbf{i}} - 10.022\hat{\mathbf{j}} = 11.938 \text{ in/s} \angle -57.09°$$

Ans.

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.45 For the mechanism in the posture illustrated, where $R_{AO_4} = 40$ mm, the 4 is rolling without slipping on rack 3 at point *B*. Determine the first-order kinematic coefficients of rack 3 and pinion 4. If $\mathbf{V}_A = 150\hat{\mathbf{i}}$ mm/s, determine the angular velocities of rack 3 and pinion 4 and the velocity of point *E*. Also, determine the velocity along rack 3 of the point of contact between links 3 and 4 (that is, point *B*).

$\rho_4 = 20$ mm and $R_{EB} = R_{BA}$.

Let the following vectors be defined: $\mathbf{R}_{AO_4} = jr_2$, $\mathbf{R}_{BA} = r_3 e^{j\theta_3}$, and $\mathbf{R}_{BO_4} = r_4 e^{j\theta_4} = jr_4 e^{j\theta_3}$.

Then the loop-closure equation is $\mathbf{R}_{AO_4} + \mathbf{R}_{BA} - \mathbf{R}_{BO_4} = \mathbf{0}$ and the scalar equations are

$$r_3 \cos\theta_3 + r_4 \sin\theta_3 = 0$$
$$r_2 + r_3 \sin\theta_3 - r_4 \cos\theta_3 = 0$$

The position solution for the given data at $r_2 = -40.0$ mm is $\theta_3 = 120°$, $r_3 = 34.641$ mm.

Taking derivatives of these equations with respect to input r_2 gives

$$\cos\theta_3 r_3' - r_3 \sin\theta_3 \theta_3' + r_4 \cos\theta_3 \theta_3' = 0$$
$$1 + \sin\theta_3 r_3' + r_3 \cos\theta_3 \theta_3' + r_4 \sin\theta_3 \theta_3' = 0$$

or, simplifying by use of the position equations and putting into matrix format,

$$\begin{bmatrix} \cos\theta_3 & r_2 \\ \sin\theta_3 & 0 \end{bmatrix} \begin{bmatrix} r_3' \\ \theta_3' \end{bmatrix} = \begin{bmatrix} 0 \\ -1 \end{bmatrix}$$

The determinant of the Jacobian is $\Delta = -r_2 \sin\theta_3$ and goes to zero when $\theta_3 = 0$ or 180°.

From these, the first-order kinematic coefficients are $r_3' = -1/\sin\theta_3$ and $\theta_3' = 1/(r_2 \tan\theta_3)$

The no-slip condition gives the displacement constraint $\pm\Delta r_3 = \rho_4(\Delta\theta_4 - \Delta\theta_3)$ from which we find $+r_3' = \rho_4(\theta_4' - \theta_3')$, which gives $\theta_4' = \theta_3' + r_3'/\rho_4$.

Therefore the first-order kinematic coefficients are

$r_3' = -1.1547$ m/m, $\theta_3' = 14.43$ rad/m, $\theta_4' = -43.30$ rad/m. *Ans.*

For $\dot{r}_2 = +0.150$ m/s, the angular velocities of links 3 and 4 are

$\omega_3 = \theta_3' \dot{r}_2 = 2.165$ rad/s ccw and $\omega_4 = \theta_4' \dot{r}_2 = -6.495$ rad/s (cw). *Ans.*

Given that $R_{EA} = 2r_3 = 69.3$ mm, the position of point *E* is $\mathbf{R}_E = x_E + jy_E = jr_2 + 69.3e^{j\theta_3}$

$$x_E = 69.3\cos\theta_3 = -34.65 \text{ mm} \quad \text{and} \quad y_E = r_2 + 69.3\sin\theta_3 = 20.02 \text{ mm}$$

The derivative with respect to input r_2 gives

$$x_E' = -69.3\sin\theta_3\theta_3' = -0.8663 \text{ m/m} \quad \text{and} \quad y_E' = 1 + 6.93\cos\theta_3\theta_3' = 0.4999 \text{ m/m}$$
$$\dot{x}_E = x_E' \dot{r}_2 = -0.129\ 95 \text{ m/s} \quad \text{and} \quad \dot{y}_E = y_E' \dot{r}_2 = 0.074\ 99 \text{ m/s}$$

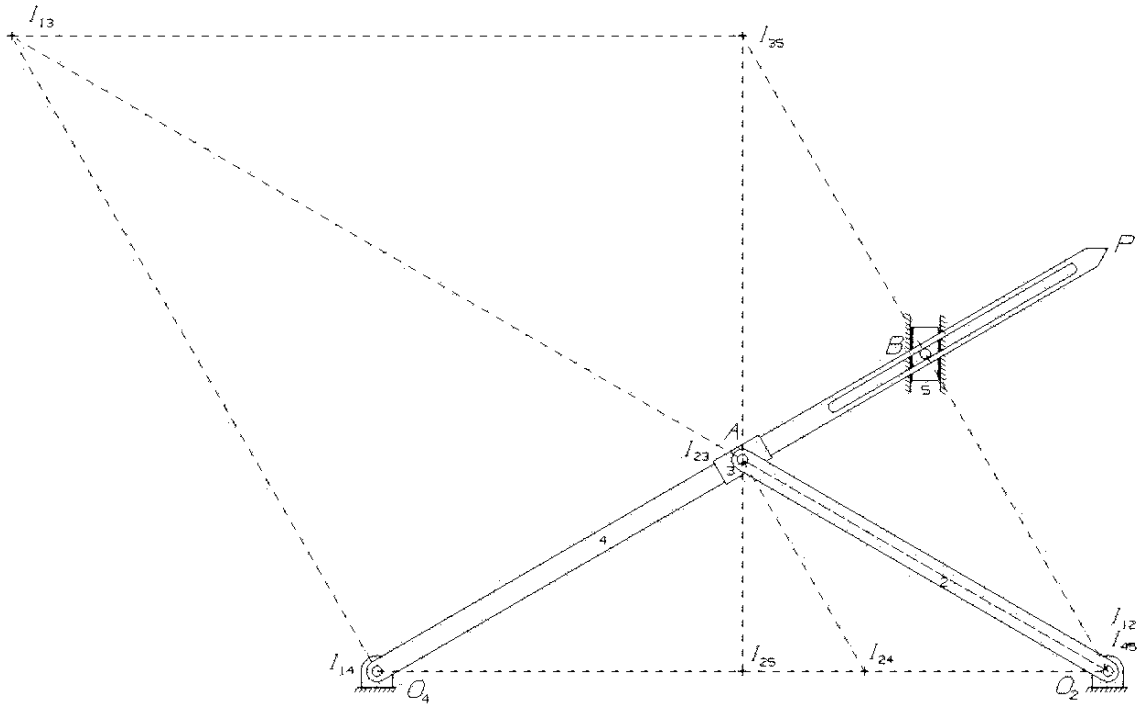

The velocity of point *E* is $V_E = 0.150\ 04$ m/s$\angle 150.01°$ *Ans.*

The velocity along rack 3 of the point of contact between links 3 and 4 is

$$V_{B_4/3} = \dot{r}_3 = r_3' \dot{r}_2 = (-1.1547 \text{ m/m})(0.15 \text{ m/s}) = -0.173\ 20 \text{ m/s}$$
$$V_{B_4/3} = 0.173\ 20 \text{ m/s}\angle -60° \quad \textit{Ans.}$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.46 For the mechanism in the posture illustrated, where $\theta_2 = 150°$, $R_{PA} = R_{AO_4}$, and $R_{PB} = R_{BA}$, determine the first-order kinematic coefficients of links 3, 4, and 5. If the angular velocity of the input link 2 is ω_2 = 5 rad/s cw, determine: (*a*) the angular velocities of links 3 and 4, (*b*) the velocity of link 5, and (*c*) the velocity of point *P* fixed in link 4.

R_{AO_2} = 10 in and R_{PO_4} = 20 in

Using instant centers, the first-order kinematic coefficients for links 3, 4, and 5 are

$$\theta_3' = \frac{R_{I_{23}I_{12}}}{R_{I_{23}I_{13}}} = \frac{-10.000 \text{ in}}{20.000 \text{ in}} = -0.500 \text{ rad/rad} \qquad \underline{Ans.}$$

$$\theta_4' = \frac{R_{I_{24}I_{12}}}{R_{I_{24}I_{14}}} = \frac{-5.774 \text{ in}}{11.548 \text{ in}} = -0.500 \text{ rad/rad} \qquad \underline{Ans.}$$

$$x_B' = 0, \quad \text{and} \quad r_B' = y_B' = R_{I_{25}I_{12}} = -8.660 \text{ in/rad} \qquad \underline{Ans.}$$

From these, with $\omega_2 = -5$ rad/s (cw),

(*a*) $\omega_3 = \theta_3'\omega_2 = 2.50$ rad/s ccw, $\omega_4 = \theta_4'\omega_2 = 2.50$ rad/s ccw $\qquad \underline{Ans.}$

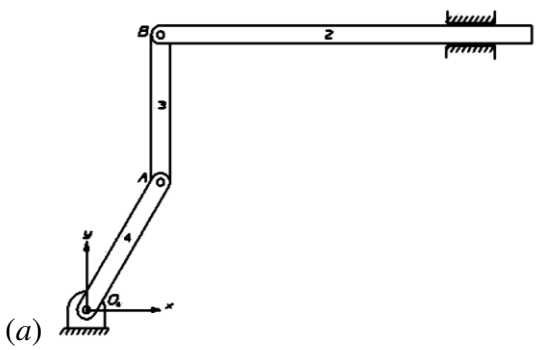

(*b*) $\mathbf{V}_B = r_B'\omega_2 = 43.30\hat{\mathbf{j}}$ in/s $\qquad \underline{Ans.}$

(*c*) $r_P' = \theta_4' R_{PI_{14}} = (-0.500 \text{ rad/rad})(20.000 \text{ in}) = -10.000 \text{ in/rad}$

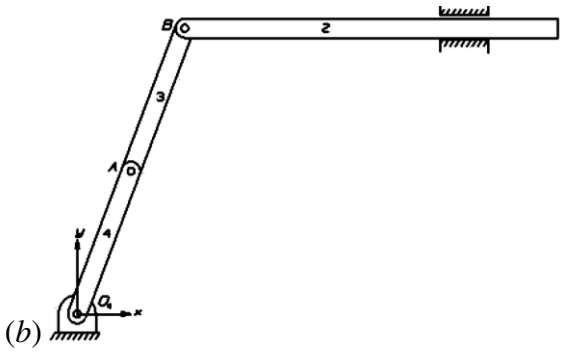

$\mathbf{V}_P = r_P'\omega_2 = 50.00 \text{ in/s} \angle 120°$ $\qquad \underline{Ans.}$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.47 For the inverted slider-crank linkage in the posture illustrated, where $\theta_4 = 60°$, the input link 2 is moving parallel to the x-axis. Determine the first-order kinematic coefficients of links 3 and 4. Also, determine the conditions for the determinant of the coefficient matrix to become zero. If $V_B = 15$ in/s constant to the right, determine the angular velocities of links 3 and 4.

(a)

(b)

$$R_{BA} = R_{AO_4} = 4 \text{ in.}$$

The two scalar loop-closure equations are

$$x_B - R_{BA}\cos\theta_3 - R_{AO_4}\cos\theta_4 = 0$$

$$y_B - R_{BA}\sin\theta_3 - R_{AO_4}\sin\theta_4 = 0$$

The solution at the current position, with $y_B = 7.464$ in, is $x_B = 2.000$ in and $\theta_3 = 90°$.

Taking the derivative with respect to input r_2 gives

$$1 + R_{BA}\sin\theta_3\theta_3' + R_{AO_4}\sin\theta_4\theta_4' = 0$$

$$-R_{BA}\cos\theta_3\theta_3' - R_{AO_4}\cos\theta_4\theta_4' = 0$$

which in matrix format becomes

$$\begin{bmatrix} R_{BA}\sin\theta_3 & R_{AO_4}\sin\theta_4 \\ -R_{BA}\cos\theta_3 & -R_{AO_4}\cos\theta_4 \end{bmatrix}\begin{bmatrix} \theta_3' \\ \theta_4' \end{bmatrix} = \begin{bmatrix} -1 \\ 0 \end{bmatrix}$$

The determinant of the Jacobian matrix is $\Delta = R_{BA}R_{AO_4}\sin(\theta_4 - \theta_3) = -8.00 \text{ in}^2$.

The first-order kinematic coefficients for links 3 and 4 are

$$\theta_3' = R_{AO_4}\cos\theta_4/\Delta = -0.25 \text{ rad/in} \quad \text{and} \quad \theta_4' = -R_{BA}\cos\theta_3/\Delta = 0 \qquad \underline{\textit{Ans.}}$$

The angular velocities are

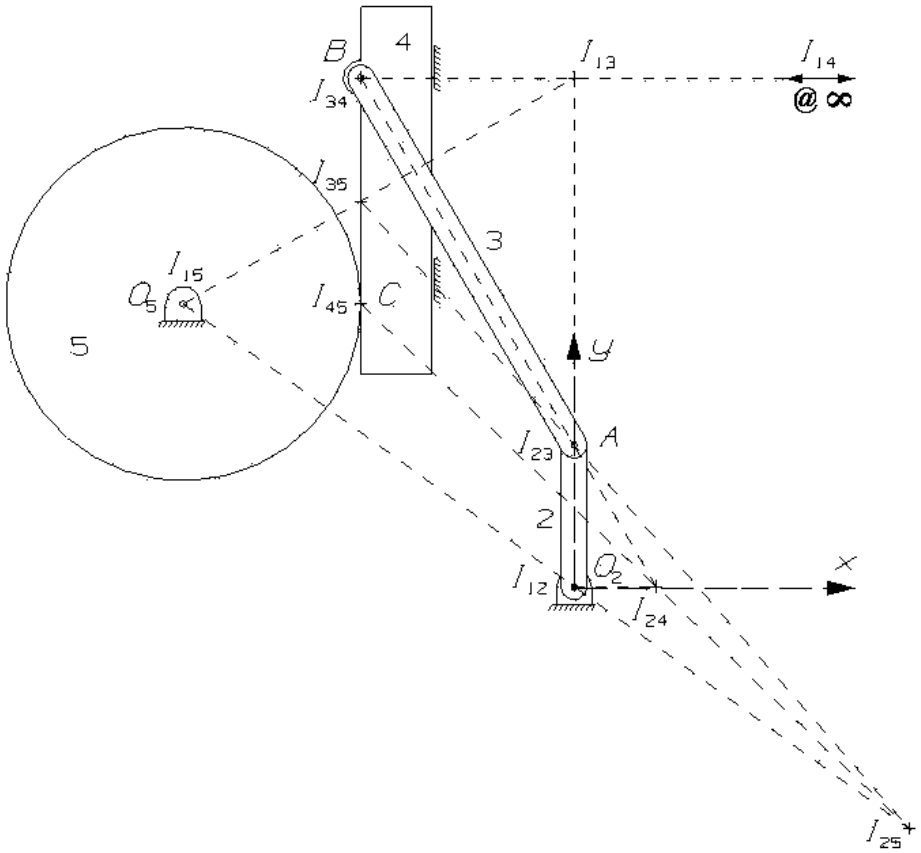

$$\omega_3 = \theta_3'\dot{r}_2 = -3.75 \text{ rad/s (cw)} \quad \text{and} \quad \omega_4 = \theta_4'\dot{r}_2 = 0 \qquad \underline{\textit{Ans.}}$$

The conditions for which $\Delta = 0$ are that $\theta_3 = \theta_4$ or $\theta_3 = \theta_4 \pm 180°$; *e.g.*, this will happen when $\theta_3 = \theta_4 = 68.907°$ and $x_B = 2.879$ in as shown in part (b) of the figure above.

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.48 For the rack-and-pinion mechanism in the posture illustrated in Figure P2.15, the input link 2 is vertical and $\angle BAO_2$ is 150°. The dimensions are $\rho_5 = 2.5$ in, $\mathbf{R}_{O_5O_2} = -8\hat{\mathbf{i}} + 4\hat{\mathbf{j}}$ in, $R_{AO_2} = 2$ in, and $R_{BA} = 6$ in. (*a*) Show the locations of all instant centers. (*b*) Using instant centers, determine the first-order kinematic coefficients of link 3, rack 4, and pinion 5. (*c*) If $\omega_2 = 10$ rad/s cw, determine the angular velocity of link 3, the velocity of rack 4, and the angular velocity of pinion 5.

(*a*) The instant centers are shown in the following figure:

(*b*) The first-order kinematic coefficients are

$$\theta_3' = \frac{R_{I_{23}I_{12}}}{R_{I_{23}I_{13}}} = \frac{2.00 \text{ in}}{-5.20 \text{ in}} = -0.385 \text{ rad/rad} \qquad \underline{\textit{Ans.}}$$

$$r_4' = R_{I_{24}I_{12}} = 1.15 \text{ in/rad} \qquad \underline{\textit{Ans.}}$$

$$\theta_5' = \frac{R_{I_{25}I_{12}}}{R_{I_{25}I_{15}}} = \frac{5.85 \text{ in}}{12.63 \text{ in}} = 0.463 \text{ rad/rad} \qquad \underline{\textit{Ans.}}$$

(*c*) The requested velocities are

$$\omega_3 = \theta_3'\omega_2 = (-0.385 \text{ rad/rad})(-10 \text{ rad/s}) = 3.85 \text{ rad/s (ccw)} \qquad \underline{\textit{Ans.}}$$

$$V_4 = r_4'\omega_2 = (1.15 \text{ in/rad})(-10 \text{rad/s}) = -11.5 \text{ in/s}(\angle -90°) \qquad \underline{\textit{Ans.}}$$

$$\omega_5 = \theta_5'\omega_2 = (0.463 \text{ rad/rad})(-10 \text{ rad/s}) = -4.63 \text{ rad/s (cw)} \qquad \underline{\textit{Ans.}}$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.49 For the mechanism in the posture illustrated in Fig. P2.16, $\rho_2 = 1$ in, $\rho_5 = 2$ in, $R_{BA} = 7.071$ in, and $R_{BC} = 6$ in. Determine the first-order kinematic coefficients of links 3, 4, and 5. If link 2 is driven at $\omega_2 = 5$ rad/s ccw, determine the angular velocities of links 3, 4, and 5.

The two scalar loop closure equations are

$$R_{O_5O_2} + \rho_5 \cos\theta_5 + R_{BC}\cos\theta_4 - R_{BA}\cos\theta_3 - \rho_2\cos\theta_2 = 0$$

$$\rho_5 \sin\theta_5 + R_{BC}\sin\theta_4 - R_{BA}\sin\theta_3 - \rho_2\sin\theta_2 = 0$$

with the rolling contact constraint equation $\rho_5\Delta\theta_5 = -\rho_2\Delta\theta_2$.

At the position $\theta_2 = 90°$ with the given dimensions the solution is $\theta_3 = 45°$, $\theta_4 = 90°$, $\theta_5 = 0°$.

The derivatives of these equations with respect to input θ_2 are

$$-\rho_5 \sin\theta_5\theta_5' - R_{BC}\sin\theta_4\theta_4' + R_{BA}\sin\theta_3\theta_3' + \rho_2\sin\theta_2 = 0$$

$$\rho_5 \cos\theta_5\theta_5' + R_{BC}\cos\theta_4\theta_4' - R_{BA}\cos\theta_3\theta_3' - \rho_2\cos\theta_2 = 0$$

with the constraint $\rho_5\theta_5' = -\rho_2$.

In matrix form, these appear as

$$\begin{bmatrix} R_{BA}\sin\theta_3 & -R_{BC}\sin\theta_4 \\ -R_{BA}\cos\theta_3 & R_{BC}\cos\theta_4 \end{bmatrix}\begin{bmatrix}\theta_3' \\ \theta_4'\end{bmatrix} = \begin{bmatrix} \rho_5\sin\theta_5\theta_5' - \rho_2\sin\theta_2 \\ -\rho_5\cos\theta_5\theta_5' + \rho_2\cos\theta_2\end{bmatrix} = \begin{bmatrix} -\rho_2(\sin\theta_5 + \sin\theta_2) \\ \rho_2(\cos\theta_5 + \cos\theta_2)\end{bmatrix}$$

The determinant is $\Delta = R_{BA}R_{BC}\sin(\theta_3 - \theta_4) = -30.000$ in^2.

At $\theta_2 = 90°$ with the given dimensions the first-order kinematic coefficients are

$$\theta_3' = \rho_2 R_{BC}\left[\sin(\theta_4 - \theta_5) + \sin(\theta_4 - \theta_2)\right]/\Delta = -0.200 \text{ rad/rad} \quad \underline{\textit{Ans.}}$$

$$\theta_4' = \rho_2 R_{BC}\left[\sin(\theta_3 - \theta_5) + \sin(\theta_3 - \theta_2)\right]/\Delta = 0 \quad \underline{\textit{Ans.}}$$

$$\theta_5' = -\rho_2/\rho_5 = -0.500 \text{ rad/rad} \quad \underline{\textit{Ans.}}$$

The angular velocities are

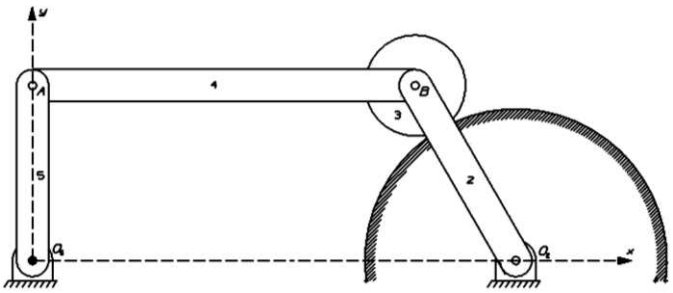

$$\omega_3 = \theta_3'\omega_2 = -0.200 \text{ rad/rad}(5 \text{ rad/s}) = -1.00 \text{ rad/s (cw)} \quad \underline{\textit{Ans.}}$$

$$\omega_4 = \theta_4'\omega_2 = 0 \quad \underline{\textit{Ans.}}$$

$$\omega_5 = \theta_5'\omega_2 = -0.500 \text{ rad/rad}(5 \text{ rad/s}) = -2.50 \text{ rad/s (cw)} \quad \underline{\textit{Ans.}}$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.50 For the mechanism in the posture illustrated in Figure P2.17, link 4 is parallel to the x-axis and link 5 is coincident with the y-axis. The radius of wheel 3 is $\rho_3 = 0.75$ in, $R_{O_2O_5} = 7.0$ in, $R_{BA} = 5.5$ in, and $R_{AO_5} = 2.6$ in. Determine the first-order kinematic coefficients of links 3, 4, and 5. If the input link 2 has an angular velocity of $\omega_2 = 15$ rad/s cw, determine the angular velocities of links 3, 4, and 5.

The two scalar equations for loop closure are

$$R_{O_2O_5} + R_{BO_2}\cos\theta_2 - R_{BA}\cos\theta_4 - R_{AO_5}\cos\theta_5 = 0$$

$$R_{BO_2}\sin\theta_2 - R_{BA}\sin\theta_4 - R_{AO_5}\sin\theta_5 = 0$$

with the rolling contact constraint equation $\rho_3(\Delta\theta_3 - \Delta\theta_2) = -\rho_1(\Delta\theta_1 - \Delta\theta_2)$, and, since $\Delta\theta_1 = 0$, this reduces to $\rho_3\Delta\theta_3 = (\rho_1 + \rho_3)\Delta\theta_2$.

At the posture where $\theta_4 = 0$, $\theta_5 = 90°$ and with the given dimensions, satisfaction of the loop closure equation requires that $R_{BO_2} = 3.001\ 67$ in, $\rho_1 = 2.251\ 67$ in, and $\theta_2 = 119.982°$.

The derivatives of the loop-closure equations with respect to input θ_2 are

$$-R_{BO_2}\sin\theta_2 + R_{BA}\sin\theta_4\theta_4' + R_{AO_5}\sin\theta_5\theta_5' = 0$$

$$R_{BO_2}\cos\theta_2 - R_{BA}\cos\theta_4\theta_4' - R_{AO_5}\cos\theta_5\theta_5' = 0$$

In matrix form, these appear as

$$\begin{bmatrix} R_{BA}\sin\theta_4 & R_{AO_5}\sin\theta_5 \\ -R_{BA}\cos\theta_4 & -R_{AO_5}\cos\theta_5 \end{bmatrix}\begin{bmatrix} \theta_4' \\ \theta_5' \end{bmatrix} = \begin{bmatrix} R_{BO_2}\sin\theta_2 \\ -R_{BO_2}\cos\theta_2 \end{bmatrix}$$

and the constraint equation derivative gives $\rho_3\theta_3' = (\rho_1 + \rho_3)$.

The determinant is $\Delta = R_{BA}R_{AO_5}\sin(\theta_5 - \theta_4) = 14.3\ \text{in}^2$.

At $\theta_2 = 120°$ with the given dimensions the first-order kinematic coefficients are

$$\theta_3' = (\rho_1 + \rho_3)/\rho_3 = 4.002\ \text{rad/rad} \qquad \underline{Ans.}$$

$$\theta_4' = R_{BO_2}R_{AO_5}\sin(\theta_5 - \theta_2)/\Delta = -0.272\ 73\ \text{rad/rad} \qquad \underline{Ans.}$$

$$\theta_5' = R_{BA}R_{BO_2}\sin(\theta_2 - \theta_4)/\Delta = 1.000\ \text{rad/rad} \qquad \underline{Ans.}$$

The angular velocities are

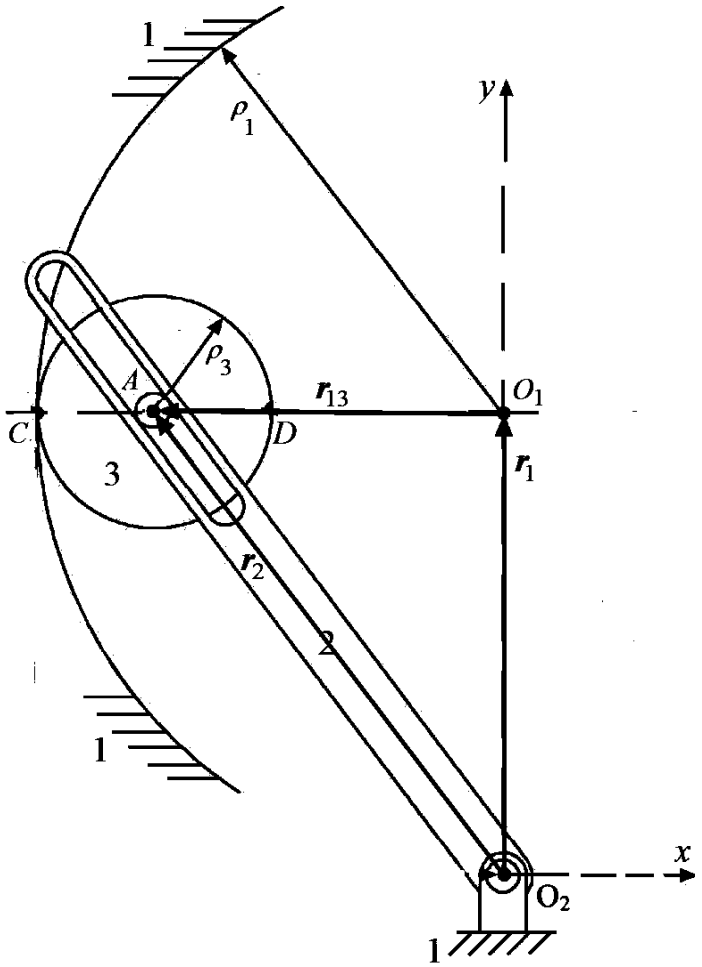

$$\omega_3 = \theta_3'\omega_2 = 4.002\ \text{rad/rad}(-15\ \text{rad/s}) = -60.033\ \text{rad/s (cw)} \qquad \underline{Ans.}$$

$$\omega_4 = \theta_4'\omega_2 = -0.272\ 73\ \text{rad/rad}(-15\ \text{rad/s}) = 4.091\ \text{rad/s (ccw)} \qquad \underline{Ans.}$$

$$\omega_5 = \theta_5'\omega_2 = 1.000\ \text{rad/rad}(-15\ \text{rad/s}) = -15.000\ \text{rad/s (cw)} \qquad \underline{Ans.}$$

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

3.51 For the mechanism in the posture illustrated, wheel 3 is rolling without slipping on the ground link at point *C* while sliding in the slot in link 2. Write the vector loop equation and determine the first-order kinematic coefficients of the mechanism. If the angular velocity of the input is $\omega_2 = 30$ rad/s ccw, determine: the angular velocity of the wheel; and the apparent velocity of the center of the wheel, point *A*, with respect to the slot in link 2.

$$\rho_1 = 60 \text{ mm}, \quad \rho_3 = 15 \text{ mm}, \quad \mathbf{R}_{CO_2} = -60\hat{\mathbf{i}} + 60\hat{\mathbf{j}} \text{ mm}, \text{ and } R_{AO_2} = 75 \text{ mm}.$$

Using the vectors shown in the figure above, the vector loop equation can be written as

$$jr_1 + r_{13}e^{j\theta_{13}} - r_2 e^{j\theta_2} = 0 \qquad \underline{Ans.}$$

From this, the two scalar equations are

$$r_{13}\cos\theta_{13} - r_2\cos\theta_2 = 0$$

$$r_1 + r_{13}\sin\theta_{13} - r_2\sin\theta_2 = 0$$

At the current posture, $r_{13} = 45$ mm and $\theta_{13} = 180°$. Therefore, these equations give

$$r_2 = 75 \text{ mm} \quad \text{and} \quad \theta_2 = \tan^{-1}(-45 \text{ mm}/60 \text{ mm}) = 126.87°.$$

The derivatives of the above loop-closure equations with respect to input θ_2 give

Theory of Machines and Mechanisms 5th edition Uicker Solutions Manual

$$-r_{13}\theta'_{13}\sin\theta_{13} - r'_2\cos\theta_2 + r_2\sin\theta_2 = 0$$
$$r_{13}\theta'_{13}\cos\theta_{13} - r'_2\sin\theta_2 - r_2\cos\theta_2 = 0$$

which in matrix format are

$$\begin{bmatrix} -r_{13}\sin\theta_{13} & -\cos\theta_2 \\ r_{13}\cos\theta_{13} & -\sin\theta_2 \end{bmatrix}\begin{bmatrix} \theta'_{13} \\ r'_2 \end{bmatrix} = \begin{bmatrix} -r_2\sin\theta_2 \\ r_2\cos\theta_2 \end{bmatrix}$$

At the current posture the determinant of the Jacobian is

$$\Delta = r_{13}\cos(\theta_{13} - \theta_2) = 27.0 \text{ mm}$$

We note that this determinant becomes zero when $\mathbf{r}_{13}$ is perpendicular to $\mathbf{r}_2$ and that this occurs at $\theta_2 = 138.59°$ and at $\theta_2 = 41.41°$.

Using Cramer's rule, the solution of the above equations for the first-order kinematic coefficients at the current position are

$$\theta'_{13} = r_2/\Delta = 75 \text{ mm}/27 \text{ mm} = 2.778 \text{ rad/rad}$$
$$r'_2 = -r_2\tan(\theta_{13} - \theta_2) = -0.100 \text{ m/rad}$$ *Ans.*

The first-order kinematic coefficient of the wheel can be obtained from the rolling contact equation. The rolling contact condition can be written as

$$\frac{\rho_1}{\rho_3} = \pm\frac{\Delta\theta_3 - \Delta\theta_{13}}{\cancel{\Delta\theta_1} - \Delta\theta_{13}}$$

Note that the positive sign must be chosen because the contact between gears 1 and 3 is internal rolling. Differentiating this equation with respect to the input position θ_2 (and using the positive sign) gives

$$\frac{\rho_1}{\rho_3} = \frac{\theta'_3 - \theta'_{13}}{-\theta'_{13}}$$

which gives

$$\theta'_3 = (1 - \rho_1/\rho_3)\theta'_{13} = -8.333 \text{ rad/rad}$$ *Ans.*

Therefore the angular velocity of the wheel is

$$\omega_3 = \theta'_3\omega_2 = (-8.333 \text{ rad/rad})(30 \text{ rad/s}) = -250 \text{ rad/s (cw)}$$ *Ans.*

and the apparent velocity of the center of the wheel, point *A*, with respect to the slot in link 2 is

$$V_{A_3/2} = r'_2\omega_2 = (-0.100 \text{ m/rad})(30 \text{ rad/s}) = -3.000 \text{ m/s}$$ *Ans.*
