Multiple Choice

1. In one of the first social psychological experiments ever conducted, researcher Norman Triplett examined the records of teams of cyclists. He found that cyclists who raced against each other ____ than those who raced alone (against the clock).

a. were more aggressive after the race
b. got into more accidents
c. cycled more quickly
d. enjoyed the race less

ANSWER: c
DIFFICULTY: Easy
REFERENCES: A Brief History of Social Psychology
LEARNING OBJECTIVES: SOCP.BAUM.21.01.01 - What is social psychology, and what were the early influences on it? Name two key ideas that had a lasting influence on the field.
KEYWORDS: Bloom's: Remember

2. In one of the first social psychological experiments ever conducted, researcher Norman Triplett built a "competition machine," in which children wind up a fishing reel. He found that the children were able to wind more quickly when ____.

a. they worked as a group side by side than when they worked alone
b. they worked alone than when they worked as a group side by side
c. they were explicitly asked to work as fast as possible
d. they were explicitly asked to take their time to "get it right"

ANSWER: a
DIFFICULTY: Easy
REFERENCES: A Brief History of Social Psychology
LEARNING OBJECTIVES: SOCP.BAUM.21.01.01 - What is social psychology, and what were the early influences on it? Name two key ideas that had a lasting influence on the field.
KEYWORDS: Bloom's: Remember

3. Based on early research by Norman Triplett, we should expect that children who work on math problems alone will ____ than children who work on math problems side by side with their classmates.

a. work more slowly
b. work more quickly
c. second-guess themselves less
d. second-guess themselves more

ANSWER: a
DIFFICULTY: Moderate
REFERENCES: A Brief History of Social Psychology
LEARNING OBJECTIVES: SOCP.BAUM.21.01.01 - What is social psychology, and what were the early influences on it? Name two key ideas that had a lasting influence on the field.
KEYWORDS: Bloom's: Apply

4. Based on early research by Norman Triplett with racing cyclists, we should expect that people who exercise on rowing machines at gyms are more likely to ____ than people who exercise on the same machines in the privacy of their homes.

a. burn more calories
b. burn less calories
c. feel a sense of accomplishment

LEARNING OBJECTIVES: SOCP.BAUM.21.01.01 - What is social psychology, and what were the early influences on it? Name two key ideas that had a lasting influence on the field.

KEYWORDS: Bloom's: Apply

5. In one of the first social psychological experiments ever conducted, researcher Max Ringelmann observed men as they pulled on a rope either alone, as part of a small group, or as part of a large group. He found that as the size of the group increased, ____.

a. individual effort increased

b. individual effort decreased

c. the task took longer to complete

d. the task took less time to complete

ANSWER: b

DIFFICULTY: Easy

REFERENCES: A Brief History of Social Psychology

LEARNING OBJECTIVES: SOCP.BAUM.21.01.01 - What is social psychology, and what were the early influences on it? Name two key ideas that had a lasting influence on the field.

KEYWORDS: Bloom's: Remember

6. Suppose you own a rowboat and enjoy going rowing on a nearby lake in the summer. In June, you are planning to go rowing with two of your friends (three people in total in the boat), and in July, you are planning to go rowing with just one friend (two people in total in the boat). Will you put in more effort (row harder) on the three-person trip or on the two-person trip?

a. You will put in more effort on the three-person trip.

b. You will put in more effort on the two-person trip.

c. You will put in the same amount of effort on both trips.

d. It is impossible to say—research is inconclusive.

ANSWER: b

DIFFICULTY: Moderate

REFERENCES: A Brief History of Social Psychology

LEARNING OBJECTIVES: SOCP.BAUM.21.01.01 - What is social psychology, and what were the early influences on it? Name two key ideas that had a lasting influence on the field.

KEYWORDS: Bloom's: Apply

7. Given Max Ringelmann's early research looking at group size and individual effort, should we expect Student X to put in a different amount of effort depending on whether she worked on a history project in a five-person group rather than a two-person group?

a. Yes, we should expect her to work harder in the five-person group.

b. Yes, we should expect her to work harder in the two-person group.

c. No, we should expect her to work equally hard in both groups.

d. It is impossible to say; it appears group size effects depend on other variables.

ANSWER: b

DIFFICULTY: Moderate

KEYWORDS: Bloom's: Understand

79. Consider the following American adages, which seem to contradict one another: "Birds of a feather flock together" and "opposites attract." What would social psychologists say about these adages?
a. This contradiction is an anomaly since Americans tend to be extremely single-minded in their "common sense" views about social psychology.
b. Most people in the United States probably believe one of these adages to be true—but not both—since most people have very clear personal theories about social psychology.
c. The contradiction is not surprising at all, since "common sense" theories are often poorly defined, i.e., most people would probably say that both of these things are true (if you asked them at different times).
d. Most people would not see the contradiction if it were pointed out to them, since the average person is not a strong logical thinker.

103. In psychology, the word "accomplice" is used to refer to ____.

a. a research assistant who poses as a participant during the course of a research study in order to help create a certain situation

b. a research participant who is purposely disruptive during a study

c. a statistician or data analyst

d. a regular research participant

ANSWER: a

DIFFICULTY: Easy

REFERENCES: How Do Social Psychologists Answer Their Own Questions?

LEARNING OBJECTIVES: SOCP.BAUM.21.01.04 - What are the five basic steps of the scientific method? Define theory, independent variable, dependent variable, operational definition, accomplice, and construct validity, and understand the essential features of an experiment, including why random assignment is essential.

KEYWORDS: Bloom's: Remember

104. In a well-known social psychological study, research participants were asked to make easy perceptual judgments ("Is Line A longer than Line B?"). The catch was that they were asked to do this while sitting around a table with people who continually gave incorrect responses—people who appeared to be other regular research participants. In reality, however, the other people at the table were actors who were working for the experimenter and posing as participants. The question in this research was whether or not the real research participant would conform to the group's opinion (even though the group's opinion was obviously wrong) or whether the real participant would stick to the right answer. In psychological jargon, the "actors" in this study would be referred to as ____.

a. accomplices

b. participant players

c. activators

d. role testers

ANSWER: a

DIFFICULTY: Easy

134. Suppose a researcher decided to study everyday altruism toward men versus women by leaving (fake) fully addressed college applications in airport lobbies (identical except with male vs. female applicant names), and then tracking the number of people who send in the application. What kind of study is this?

a. A laboratory study

b. A field experiment

c. A correlational study

d. A quasi-experiment

ANSWER: b
DIFFICULTY: Moderate
REFERENCES: How Do Social Psychologists Answer Their Own Questions?
LEARNING OBJECTIVES: SOCP.BAUM.21.01.05 - Describe the benefits and drawbacks of field experiments compared to laboratory experiments, and explain how correlational methods can describe the relationship between variables when traditional laboratory experiments cannot be used.
KEYWORDS: Bloom’s: Apply

135. Researchers often attempt to design studies that will be high in both experimental realism and mundane realism. However, ____.

a. experimental realism is generally considered to be far more important

b. mundane realism is generally considered to be far more important

c. experimental realism is really only important in true experiments

d. mundane realism is almost impossible to achieve in practical terms

ANSWER: a
DIFFICULTY: Moderate
REFERENCES: How Do Social Psychologists Answer Their Own Questions?
LEARNING OBJECTIVES: SOCP.BAUM.21.01.05 - Describe the benefits and drawbacks of field experiments compared to laboratory experiments, and explain how correlational methods can describe the relationship between variables when traditional laboratory experiments cannot be used.

137. If an experiment does NOT get participants psychologically involved and engaged, even though the setting of the experiment closely resembles the real world physically, then the experiment would be said to be ____.

a. low in experimental realism and low in mundane realism
b. low in experimental realism but high in mundane realism
c. high in experimental realism but low in mundane realism
d. high in experimental realism and high in mundane realism

ANSWER: b
DIFFICULTY: Moderate
REFERENCES: How Do Social Psychologists Answer Their Own Questions?
LEARNING OBJECTIVES: SOCP.BAUM.21.01.05 - Describe the benefits and drawbacks of field experiments compared to laboratory experiments, and explain how correlational methods can describe the relationship between variables when traditional laboratory experiments cannot be used.
KEYWORDS: Bloom's: Understand

138. Suppose you are a research participant in a laboratory study that is examining fear and social support. The researcher shows you an extremely scary movie and then asks you whether you feel like talking to anyone (and if so, who) once the movie is over. Although you are in a laboratory setting the whole time, which does not resemble "real life" at all, you become engrossed in the procedures of the study and almost forget that you are in a study. Thus, in your experience, this study is:

a. low in experimental realism and low in mundane realism
b. low in experimental realism and high in mundane realism
c. high in experimental realism and low in mundane realism
d. high in experimental realism and high in mundane realism

ANSWER: c
DIFFICULTY: Moderate
REFERENCES: How Do Social Psychologists Answer Their Own Questions?
LEARNING OBJECTIVES: SOCP.BAUM.21.01.05 - Describe the benefits and drawbacks of field experiments compared to laboratory experiments, and explain how correlational methods can describe the relationship between variables when traditional laboratory experiments cannot be used.
KEYWORDS: Bloom's: Apply

139. Compared to laboratory experiments, field experiments tend to be ____.

a. low in internal validity and low in external validity
b. low in internal validity and high in external validity
c. high in internal validity and low in external validity
d. high in internal validity and high in external validity

ANSWER: b
DIFFICULTY: Difficult

Essay

206. Describe the experiments of Norman Triplett and Max Ringelmann and explain their contributions to (social) psychology.

ANSWER: Indiana University professor Norman Triplett conducted one of the first social psychology experiments in 1897. While examining the cycling records for the 1897 season, he noticed that bicycle riders who competed against others performed better than those who competed against the clock. Triplett proposed that the presence of another rider releases a competitive instinct, which increases "nervous energy" and thereby enhances individual performance. Triplett tested his hypothesis by building a "competition machine." He had 40 children wind up a reel, alternating between working alone and working side-by-side to each other. Winding times were faster when children worked side-by-side than when they worked alone. Thus, the mere presence of another person enhanced performance on this simple task. Social psychologists call this phenomenon "social facilitation."

Another early social psychological experiment was conducted in the 1880s by a French professor of agricultural engineering named Max Ringelmann. He had men pull on a rope alone and as part of a group, and he measured the amount of effort exerted by each participant. He found that as group size increased, individual effort decreased. Social psychologists call this phenomenon "social loafing." This study can explain why people tend to slack off when working on group projects.

207. Explain how psychology was divided into two camps during the 1950s and 1960s.

ANSWER: Social psychology began to come into its own as a field in the 1950s and 1960s. At the time,

Social Psychology and Human Nature 5th edition Baumeister Test Bank

psychology was divided between two camps. One camp, known as behaviorism, sought to explain human behavior in terms of learning principles such as reward and punishment. (Countless studies were conducted with white laboratory rats in order to establish these principles.) Behaviorists were opposed to talking about the mind, thoughts, emotions, or other inner processes, focusing instead on observable actions that could be studied experimentally using the scientific method.

The other camp was Freudian psychoanalysis, which preferred elaborate interpretations of individual experiences (especially from clinical practice) instead of experimental studies that counted behaviors. Social psychology was not really compatible with either camp. Social psychology was more congenial to the behaviorist camp in that it favored experiments and the scientific method, but it was also sympathetic to the Freudian camp with its interest in inner states and processes. For a while, social psychology sought to steer a middle course.

Eventually (by the 1970s and 1980s), social psychology found its own way, using scientific approaches to measure not only behavior, but also thoughts, feelings, and other inner states.

LEARNING OBJECTIVES: SOCP.BAUM.21.01.01 - What is social psychology, and what were the early influences on it? Name two key ideas that had a lasting influence on the field.

KEYWORDS: Bloom's: Understand

208. Describe the relationship between social psychology and developmental psychology.

ANSWER: Developmental psychology is the study of how people change across their lives, from conception and birth to old age and death. In practice, most developmental psychologists study children. Developmental psychology has borrowed much from social psychology and built on it, such as by studying at what age children begin to show various patterns of social behavior. Developmental psychology also has often borrowed social psychology theories.

Until now, social psychology has not taken much from developmental psychology, though this may be changing. Social psychologists interested in self-regulation, emotion, gender differences, moral reasoning, prosocial behavior, and antisocial behavior sometimes look to the research on child development to see how these patterns get started.

209. What is the difference between applied research and basic research?

ANSWER: The desire to fix particular problems causes some social scientists to focus their study on the specific problem, such as the plight of welfare mothers, or why people don't wear seat belts, or how to get people to conserve electric power. These scholars conduct what is called applied research, because the research is applied to a specific problem. There are specific journals in social psychology that focus on applied research, such as the Journal of Applied Social Psychology.

Others, however, try to advance the cause of knowledge generally, in the hope that creating a solid knowledge base will eventually result in a general understanding of basic principles that can be applied to many different problems. These scholars conduct what is called basic

Copyright Cengage Learning. Powered by Cognero.

research.

When Kurt Lewin, one of the founding fathers of social psychology, was asked whether his research had sufficient practical value, he answered, “There is nothing as practical as a good theory.” Some journals, such as the journal Basic and Applied Social Psychology, focus on both basic and applied social psychological research.

210. Explain the hindsight bias and give an example.

ANSWER: The fact that something seems like common sense (especially after the fact) illustrates the hindsight bias or the “knew it all along” phenomenon, which is the tendency, after an event has occurred, to overestimate one’s ability to have foreseen the outcome. The problem is that most things seem intuitive after the fact.

The hindsight bias often causes trouble for students in social psychology courses. The course material seems easy, even obvious. On a multiple-choice test where there are several plausible options, however, the task becomes surprisingly difficult. Students say, “I thought I knew the material,” but their level of understanding was shallow. So don’t fall into the trap of thinking, “I don’t need to study this material—it is just common sense.” But when confronted with the test, they see that common sense can make a case
for multiple different answers.

Human intuition or common sense is a poor method for discovering truth. Yet, over half of Americans rely on their gut to decide what to believe.

Although common wisdom or common sense is probably right more often than it is wrong, that is not good enough for science. In the long run, science can find the right answers to almost everything that can be measured in a reliable and valid manner. (In the short run, scientists have to be content with slowly making progress toward the truth, such as replacing a partly right and partly wrong theory with another theory that is still partly wrong but a little more right.) Hence, social psychologists do not rely too heavily on common sense or accumulated wisdom. If anything, they have often had to justify their scientific studies by finding patterns that go against common sense. At most, common sense provides a good starting point for social psychologists to do their work. They can take ideas that everyone assumes to be true and find out which ones really are true, as opposed to which ones are false. As for those that are sometimes true and sometimes false, social psychologists can study what factors determine when they are true and when they are false.

An example of hindsight bias is the following. Employees at a company are not surprised when they hear that the accountant of the company was arrested for embezzling company funds. They had previously already wondered how he was able to own a flashy car and how he could afford such luxury vacations. So, when they heard he embezzled money, they said “they knew it all along.”

construct validity, and understand the essential features of an experiment, including why random assignment is essential.

KEYWORDS: Bloom's: Understand

211. Explain scientific theories in detail.

ANSWER: Social psychologists are not content to know what people do; they also want to know why they do it. That is why psychologists derive their hypotheses from theories.

Theories are composed of constructs (abstract ideas or concepts) that are linked together in a logical way. They are called "constructs" because the researcher must construct them or build them up by specifying their dimensions. For example, the construct of "aggression" may have multiple dimensions such as physical versus verbal, direct versus indirect, passive versus active. A theory is more than a hunch—it explains why something is expected to occur.

In science, a theory is not just a guess. It's a well-substantiated, well-supported, well-documented explanation for observations. For example, just because it's called the "theory of gravity," doesn't mean that it is just a guess. The theory of gravity is based on well-established physics principles, has been tested many times, and has been supported by many observations. Likewise, social psychological theories are not just guesses or hunches about human behavior.

Define theory, independent variable, dependent variable, operational definition, accomplice, and construct validity, and understand the essential features of an experiment, including why random assignment is essential.

KEYWORDS: Bloom's: Remember

212. What is meant by deception studies?

ANSWER: Deception studies are research studies that withhold information from participants or intentionally mislead them about the purpose of the study. It is natural for research participants to try to figure out what a study is about. They want to know what the researcher's hypothesis is. Any cues that convey the hypothesis to participants are called demand characteristics, and they can influence how participants behave. For example, some participants want to help the researcher out by confirming the hypothesis. Other participants want to do the opposite and disprove the researcher's hypothesis. To reduce demand characteristics, researchers sometimes give participants false information about the purpose of the study.

These deception studies must include a debriefing at the end where participants are given a full description of the purpose of the study, including revealing any deception that was involved. The debriefing serves two main purposes:
(1) to fully inform participants about the study and answer any questions they have, and
(2) to reduce or eliminate any stress or harm the participant experienced by being in the study.

One might think participants would be angered after learning they have been deceived. In actuality, they usually understand the need for deception and actually enjoy studies that use deception more than studies
that use no deception, mainly because they think the deception studies are more interesting to participate in.

Copyright Cengage Learning. Powered by Cognero.

Social Psychology and Human Nature 5th edition Baumeister Test Bank

For a researcher to use deception, he or she must demonstrate that the potential scientific gains outweigh any potential costs to participants. This is the big tradeoff in social psychology studies.

KEYWORDS: Bloom's: Understand

213. Explain the correlational approach. Why do social psychologists adopt this research technique?

ANSWER: Although social psychologists generally prefer experimental studies, sometimes they cannot be used. The two hallmarks of an experiment are control and random assignment. If control is possible but random assignment is not, a quasi-experimental study can be conducted. However, some variables cannot be controlled and random assignment cannot be used for practical or ethical reasons, such as gender, race, ethnicity, marital status, and age. For example, suppose a researcher is interested in the relationship between combat experiences in war and post-traumatic stress disorder (PTSD). It would be unethical to control the frequency, intensity, and duration of combat war experiences, and to randomly assign participants to have or not have combat war experiences.

Faced with such difficulties, social psychologists often adopt an alternative research technique known as the correlational approach. In this approach, the researcher does not try to control variables or randomly assign participants to groups. Instead, the researcher merely observes whether variables go together normally. Such associations are called correlations. A correlation gives the statistical relationship or association between two variables. When a correlation is positive, as one variable goes up the other variable also goes up. For example, there is a positive correlation between smoking cigarettes and lung cancer: The more cigarettes people smoke, the more likely they are (on average) to get lung cancer. When a correlation is negative, as one variable goes up the other variable goes down. For example, there is a negative correlation between time spent playing video games and grades in college: The more time college students spend playing video games, the lower their grade point average is. When there is no correlation, the two variables are not related in a linear fashion. For example, there is no correlation between IQ scores and shoe size.

214. What is meant by a replication crisis? How can one deal with it?

ANSWER: A replication crisis is a methodological crisis in which scientists have found that many scientific studies conducted in the past do not replicate, or if they do the effects tend to be smaller in size. Recently, science has undergone a replication crisis. A survey of 1,576 scientists published in Nature found that 70% of them have tried and failed to replicate another scientist's experiments, and over 50% have failed to replicate their own experiments. Among those surveyed, 52% agreed there is a significant replication crisis, 38% agreed that there is a slight crisis, 7% were unsure, and only 3% thought there was no crisis.

The replication crisis seems to extend to all fields of science, including psychology. A large-

Copyright Cengage Learning. Powered by Cognero.

Social Psychology and Human Nature 5th edition Baumeister Test Bank

scale collaborative project attempted to determine the extent of the replication crisis within the field of psychology. Researchers attempted to replicate 100 previously published psychological studies. The results found that the average effect obtained in the replicated studies was about half the size (r 5 .20) of the average effect obtained in the original studies (r 5 .40), which was a significant decline. Like other scientific fields, psychology is coming to grips with the fact that some published findings are not as robust as we thought they were.

Several suggestions have been offered to deal with the replication crisis in psychology. One suggestion is to control what are described as "researcher degrees of freedom," which refers to the arbitrary decisions that researchers make when collecting and analyzing data (e.g., when to stop collecting data, what variables and observations to exclude from the analyses). Another common solution to the replication crisis is to conduct larger replication studies with sufficient statistical power. This solution has practical limitations, in terms of time and money. Meta-analysis provides another solution to the replication crisis, one that does not involve collecting larger samples of primary data. There is no issue of replication in a meta-analysis, and it has the advantage of including individual studies that use different methods and different operational variables.

215. Is the reliance on samples of college students for most social psychology experiments a problem?

ANSWER: Many people worry less about whether the findings of social psychology experiments are correct than about whether they are generalizable. These questions arise because most studies in social psychology are done with college students, who are easier to find for research (especially because most researchers are college or university professors). Some argue that students might not be typical of everyone else, so a social psychology based on college students might not generalize to other groups, such as the elderly, middle-aged corporate executives, or homeless people.

Periodically, social psychologists seek to replicate their studies using other groups. In general, the results are quite similar. College students do not differ all that fundamentally from other people in most respects. When they do differ, it is often more a matter of degree than of behaving according to different principles. A social psychology experiment typically seeks to establish whether some causal relationship exists—such as whether frustration causes aggression. As it happens, college students do become more aggressive when frustrated, but so do most other people. It might be that some groups will respond with more extreme aggression and others with less, but the general principle is the same: Frustration causes aggression.

Social psychology is also mainly interested in normal, typical people. College students are drawn from a broad segment of normal people, and so findings based on them typically can be generalized to other typical groups. One should be careful generalizing from findings based on students (or on other normal groups) to very unusual groups. When college students do differ from other people, these differences are probably limited to a few specific areas, and researchers interested in them should be cautious. On average, college students may be more thoughtful than others, and more intelligent (because people of low intelligence are less likely to go to college).

Their self-concepts may be less firmly established because most college students are still in the process of building their adult identities. They may have less experience with the burdens

Social Psychology and Human Nature 5th edition Baumeister Test Bank

	of responsibility than other adults who must cope with the demands of work and taking care of a family. They may come from slightly more affluent backgrounds and have somewhat smaller proportions of ethnic minorities than the population at large. None of these differences is likely to make students radically different from other people. Hence, social psychology's disproportionate reliance on studying college students does not represent a serious problem.
