2

2.1 $\dfrac{d(C\cdot \mathrm{V})}{dt}=\dfrac{dM}{dt}=\dot{M}_{\mathrm{IN}}-\dot{M}_{\mathrm{OUT}}$

a) at steady state

$$\dot{M}_{\mathrm{IN}}=1\frac{\mathrm{g}}{\mathrm{min}}=\dot{M}_{\mathrm{OUT}}=C\cdot\text{volumetric flow rate out}$$

$$1\frac{\mathrm{g}}{\mathrm{min}}=C\times\frac{10\mathrm{m}^3}{\mathrm{min}} \qquad C=\frac{1}{10}\frac{\mathrm{g}}{\mathrm{m}^3}=0.1\frac{\mathrm{g}}{\mathrm{m}^3}$$

b) $\mathrm{V}\dfrac{dC}{dt}=\dot{M}-C\times 10\dfrac{\mathrm{m}^3}{\mathrm{min}}$ $\mathrm{V}\dfrac{dC}{dt}=\dot{M}-C-10\dfrac{\mathrm{m}^3}{\mathrm{min}}$

$\mathrm{V}=6\times 6\times 3=108\ \mathrm{m}^3$ $\mathrm{V}=6\times 6\times 3=108\ \mathrm{m}^3$

$$108\mathrm{m}^3\frac{dC}{dt}=1\frac{g}{\mathrm{min}}-C\times\frac{10\mathrm{m}^3}{\mathrm{min}}$$

$$\frac{dC}{dt}=\frac{1}{108}\frac{g}{\mathrm{m}^3\,\mathrm{min}}-C\frac{10}{108}\mathrm{m}^{-1}$$

or for C in g/m^3

$$108\frac{dC}{dt}=-(10C-1) \qquad 10.8\frac{dC}{(C-0.1)}=-dt$$

$$10.8\ln\frac{(\mathrm{C}\text{-}0.1)}{(\ -0.1)}=-t$$

For $C = 0.95 * 0.1 = 0.095$ $\quad 10.8\ln\left(\dfrac{-0.005}{-0.1}\right)=-t$

$108 \ln 20 = t$ $\quad t = 32.35$ minutes

2.2 $\dfrac{dC}{dt}=-kC$ $\qquad \ln\dfrac{C_f}{C_i}=-kt$

If $C_f = 0.5\ C_i$ $\quad \ln 0.5 = -kt$ or $k=\dfrac{\ln 2}{t}$

for a half life of seven years $\quad k = 0.099\ \text{years}^{-1}$

so that

$$\ln\frac{\mathrm{C_f}}{22}=-\mathrm{k}\ 25=-0.099\times 25=-2.475$$

$$\mathrm{C_f}=22\exp(-2.475)=1.85\ \text{ppm}$$

2.3 Basis: 2-liter vessel = 2000 cm^3 $= 2\times10^3\times10^{-6}\dfrac{\mathrm{m}^3}{\mathrm{cm}^3}=2\times10^{-3}\ \mathrm{m}^3$

Initial moles of phosphine $= 5\ \dfrac{\mathrm{kmol}}{\mathrm{m}^3}\times10^3\ \dfrac{\mathrm{mol}}{\mathrm{kmol}}\times2\times10^{-5}\mathrm{m}^3 = 10$ mol

Chemical Biochemical and Engineering Thermodynamics 5th edition Sandler Solutions Manual

a) Mass balance from stoichiometry

Species	Initial	Final
PH_3	10	$10 - 4X = 7$
P_4	0	X
H_2	0	$6X$

Since $10 - 4X = 7$ $\quad 3 = 4X$ $\quad X = ¾$

$\Rightarrow P_4 = 0.75$ moles

$H_2 = 6$ moles

b) C_{PH_3} at any time $= \dfrac{(10-4X) \text{ moles}}{2\times10^{-3}\text{m}^3} = (5-2X)\times10^{-3}\dfrac{\text{moles}}{\text{m}^3}$

Therefore

$$\frac{dC_{PH_3}}{dt} = 3.715\times10^{-6}C_{PH_3}$$

$$-2\times10^{-3}\frac{dX}{dt} = -3.715\times10^{-6}(5-2X)\times10^{-3}$$

$$\frac{dX}{dt} = 3.715\times10^{-6}(2.5-X)$$

$$-\frac{dX}{2.5-X} = \frac{d(2.5-X)}{2.5-X} = -3.715\times10^{-6}dt$$

$$\ln(2.5-X)_t - \ln(2.5-X)_0 = -3.715\times10^{-6}t$$

$$\frac{2.5-X}{2.5} = e^{-2.715\times10^{-6}t}$$

$$2.5-X = 2.5\,e^{2.715\times10^{-6}t}$$

$$X = 2.5\left(1-e^{-2.715\times10^{-6}t}\right)$$

Therefore

$$\text{Moles } PH_3 = 10-4X = 10-10\left(1-e^{-2.715\times10^{-6}t}\right) = 10\,e^{-2.715\times10^{-6}t}$$

$$\text{Moles } PH_4 = 2.5\left(1-e^{-2.715\times10^{-6}t}\right)$$

$$\text{Moles } H_2 = 15\left(1-e^{-2.715\times10^{-6}t}\right)$$

Time required for 3 moles to react = time for $X = 0.75$

$$X = 2.5\left(1-e^{-2.715\times10^{-6}t}\right) = 0.75$$

$$T = 1.314\times10^5 \text{ sec} = 36.49 \text{ hours}$$

2.4 $2\,NO + O_2 \rightarrow 2\,NO_2$

a) 0.5 moles NO produces 0.5 moles NO_2

b)

Species	Initial Conc	Conc. at X
NO	1	$1-2X$
O_2	3	$3-X$
NO_2	0	$6X$
		$4-X$

$$\frac{dC_{NO}}{dt} = -1.4\times10^{-4}C_{NO}^2C_{O_2}$$

$$\frac{d(1-2X)}{dt} = -1.4\times10^{-4}(1-2X)^2(3-X) = -2\frac{dX}{dt}$$

Chemical Biochemical and Engineering Thermodynamics 5th edition Sandler Solutions Manual

$$\Rightarrow \qquad \frac{dX}{dt} = 0.7\times10^{-4}\,(1\text{-}2X)^2\,(3\text{-}X)$$

$$0.7 \times 10^{-4}\, t = \frac{1}{5(1\text{-}2X)} + \frac{1}{25}\ln\frac{(2X\text{-}1)}{(X\text{-}3)}$$

Now for 0.5 mole of NO to react $\Rightarrow 1 - 2X = 0.5$ $X = 0.25$

$$0.7\times10^{-4}t = \frac{1}{5\times0.5} + \frac{1}{25}\ln(0.5/2.75) = 0.332$$

$$t = \frac{0.332}{0.7}\times10^{4} = 0.474\times10^{4}\text{sec} = 1.317 \text{ hrs}$$
