Fundamentals Of Corporate Finance (Canadian) 10th edition Ross Test Bank

242. Which of the following accurately describes the relation between book and market value?
A. Financial managers should rely on book values, and not market values, when making decisions for the firm, because the firm's tax liability is based on book values.
B. Financial managers should rely on market values, and not book values, when making decisions for the firm, because the firm's tax liability is based on market values.
C. Book value is an accounting summary of value and is inferior to market value as a source of current information regarding the true value of the firm.
D. The market value of current assets is often difficult to determine, and thus of little value to the decision making process of financial managers.
E. Market value always exceeds book value.

243. Calculate the tax difference between a British Columbia resident and an Ontario resident both having $20,000 in interest income and $25,000 in capital gains.

Combined marginal tax rates for individuals in top provincial tax brackets

Fundamentals Of Corporate Finance (Canadian) 10th edition Ross Test Bank

Provinces/Territories	Interest and Regular Income (%)	Capital Gains (%)	Eligible Dividends (%)	Non-eligible Dividends (%)
British Columbia	45.80	22.90	28.68	37.98
Alberta	39.00	19.50	19.29	29.36
Saskatchewan	44.00	22.00	24.81	34.91
Manitoba	46.40	23.20	32.27	40.77
Ontario	49.53	24.77	33.82	40.13
Quebec	49.97	24.99	35.22	39.79
New Brunswick	46.84	23.42	27.35	36.02
Nova Scotia	50.00	25.00	36.06	39.07
Prince Edward Island	47.37	23.69	28.71	38.74
Newfoundland and Labrador	42.30	21.15	30.20	32.08

A. British Columbia resident would pay $1,213.50 more than the Ontario resident.
B. British Columbia resident would pay $1,213.50 less than the Ontario resident.
C. British Columbia resident would pay $1,456.50 more than the Ontario resident.
D. British Columbia resident would pay $1,456.50 less than the Ontario resident.
E. There are no tax differences between the two tax payers.

Short Answer Questions

Fundamentals Of Corporate Finance (Canadian) 10th edition Ross Test Bank

397. An impairment loss is defined as the amount by which the carrying value of an asset or cash-generating unit exceeds its recoverable amount. What is the implication of an impairment loss on a firm's financial statements?

The difference between a company's carrying amount and its recoverable amount is considered an impairment loss. This means that the firm will have to write-down and reduce the value of the asset, while also recording an impairment loss expense. The effect will lower Total assets and equity categories in the statement of financial position. Additionally, the impairment loss will lower the statement of comprehensive income that will flow into the shareholders' equity category previously mentioned.

398. Discuss how financial statement accounts are inter-connected along with the order that financial statements should be prepared.

There are extensive connections between accounts in the statement of financial position and the statement of comprehensive income. For instance, accounts receivable relates to revenue account; while inventory relates to cost of goods sold. Additionally, accounts payable relates to a variety of expense accounts.

400. Discuss the difference between book values and market values on the statement of financial position and explain which is more important to the financial manager and why.

The accounts on the statement of financial position are generally carried at historical cost, not market values. Although the book value of current assets and current liabilities may closely approximate market values, the same cannot be said for the rest of the statement of financial position accounts. Ultimately, the financial manager should focus on the firm's stock price, which is a market value measure. Hence, market values are more meaningful than book values.

Fundamentals Of Corporate Finance (Canadian) 10th edition Ross Test Bank

401. Explain why the statement of comprehensive income is not a good representation of cash flow.

Most statement of comprehensive incomes contain some noncash items, so these must be accounted for when calculating cash flows. More importantly, however, since GAAP is used to create statement of comprehensive incomes, revenues and expenses are booked when they accrue, not when their corresponding cash flows occur.

402. Why is interest expense excluded from the operating cash flow calculation?

Operating cash flow is designed to represent the cash flow a firm generates from its day-to-day operating activities. Interest expense arises out of a financing choice and thus should rightfully be considered as a cash flow to creditors.

403. Note that in all of our cash flow computations to determine cash flow from assets, we never include the addition to retained earnings. Why not? Is this an oversight?

The addition to retained earnings is not a cash flow. It is simply an accounting entry that reconciles the statement of financial position. Any additions to retained earnings will show up as cash flow changes in other statement of financial position accounts.

404. Explain the effects depreciation has on both the cash flows and the statement of comprehensive incomes of a firm.

Depreciation reduces both the taxable and net income of a firm as reflected on the statement of comprehensive incomes. While depreciation itself is a noncash expense it does affect the cash flows indirectly by reducing the cash outflow for taxes.

405. If depreciation is added back to operating cash flow and to additions to fixed assets, does this process add deprecation back twice? Is it not double-counting?

In both cases, depreciation is added back because it was previously subtracted when obtaining ending balances of net income and fixed assets. And, since depreciation is a noncash expense, we need to add it back in both instances, so there is no double counting.

406. Sometimes when businesses are critically delinquent on their tax liabilities, the tax authority comes in and literally seizes the business by chasing all of the employees out of the building and changing the locks. What does this tell you about the importance of taxes relative to our discussion of cash flow? Why might a business owner want to avoid such an occurrence?

Taxes must be paid in cash, and in this case, they are one of the most important components of cash flow. The reputation of a business can undergo irreparable harm if word gets out that the tax authorities have confiscated the business, even if only for a couple of hours until the business owner can come up with the money to clear up the tax problem. But, the bottom line is, if the owner can't come up with the cash, the tax authority has effectively put them out of business.

407. What does cash flow from assets represent? Elaborate by discussing operating cash flow, changes in net working capital, and additions to fixed assets.

Operating cash flow is the cash flow a firm generates from its day-to-day operations. In other words, it is the cash inflow generated as a result of putting the firm's assets to work. Changes in net working capital and fixed assets represent investments a firm makes in these assets. That is, a firm typically takes some of the cash flow it generates from using assets and reinvests it in new assets. Cash flow from assets, then, is the cash flow a firm generates by employing its assets, net of any acquisitions.

408. Discuss the differences between net income and cash flow from operations. Which measure is more relevant to a corporate treasurer and why?

Noncash items, such as depreciation, reduce net income but do not affect cash flows. Interest expense is a cost of financing and not an operating expense; therefore it reduces net income but does not affect cash flow from operations. Cash flows are more relevant to the corporate treasurer since his/her focus is on the cash management of a firm and not the accounting management.

409. Explain why cash flow from assets must be positive over the long-term if a firm is to remain financially solvent.

Cash flow from assets must be positive over the long-term as a firm must be able to financially support its own operations. In the short-term, firms can borrow money and issue new securities in order to finance a negative cash flow from assets. However, if a firm does not show that it is financially viable after a period of time, the firm will no longer be able to raise funds in the capital markets.

410. How can you determine if a firm is self-sustaining by reviewing the firm's cash flow from assets?

If a firm's cash flow from assets is positive, you know that the firm is producing sufficient cash flow to meet the firm's normal operating costs. If the cash flow from assets is greater than the cash flow to creditors, then you also know that the firm is meeting its debt obligations and has some cash flow remaining which can be distributed to the firm's shareholders.

412. When the half-year rule was introduced, do you think firms looked favourably or unfavourably upon the change?

Firms who purchased assets in January could now use only one-half of its original cost to calculate depreciation for the year, compared to the full cost that could have been used under the old system. Also, firms who could previously claim the original cost for a whole year, even thought they had only purchased and put in use the asset in December, had a reduction in the amount they could claim. (Therefore, all firms claim a smaller amount of depreciation in the first year so that their taxes increase and usable cash flows decrease.) Therefore, firms would not be in favour of the change.
