CHAPTER 4
PROJECT

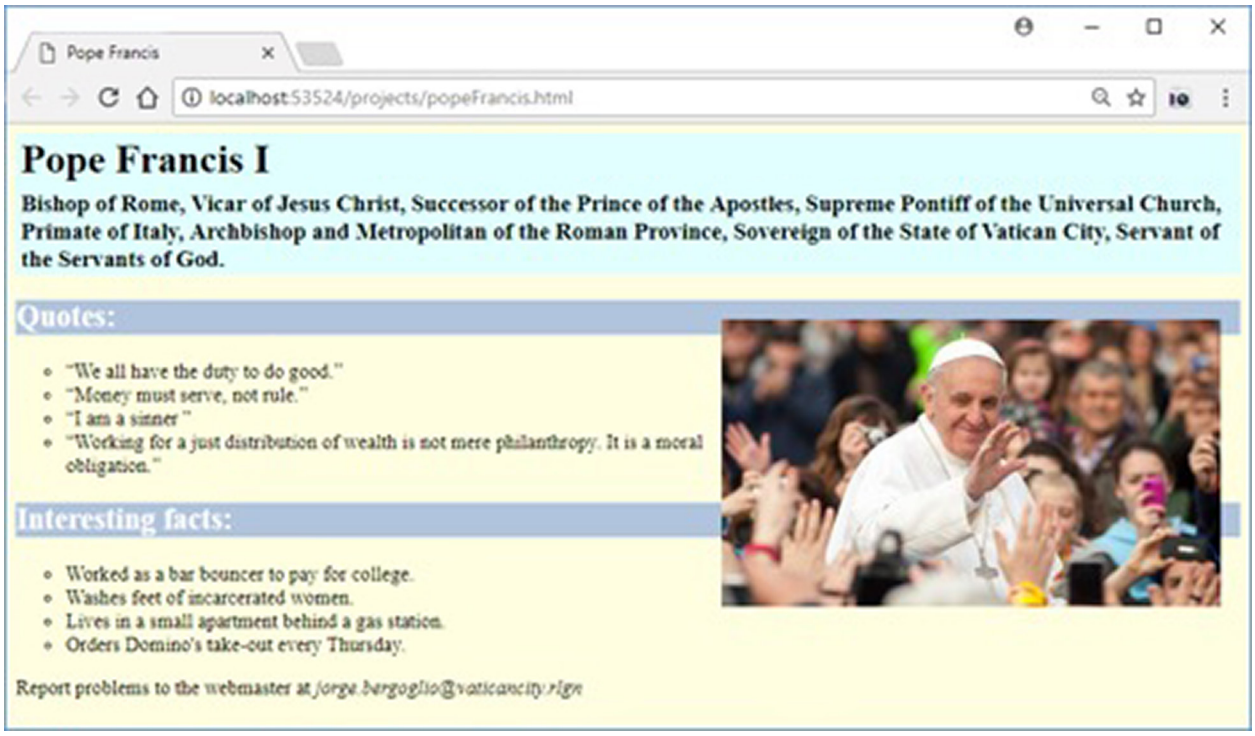

Web Programming with HTML5, CSS, and JavaScript/First Edition

John Dean

Implement a web page that displays a Pope Francis web page as shown in the screenshot below.

As always, make sure you use appropriate containers so that your web page's content is properly defined. In particular, you should include `header`, `aside`, `article`, `section`, and `figure` elements.

In the screenshot below, note the two headings in the light blue header at the top. Normally, those heading elements would introduce more of a gap between them than what you see in the web page. To implement the web page's smallish gap, you are required to use a child selector CSS rule that matches all elements within the `header` container.
