161. The following is a list of software:

Software:

A.	Customer relationship management (CRM) software	D.	Supply chain management (SCM) software
B.	Customer self-service (CSS) software	E.	Product life-cycle management (PLM) software
C.	Sales force automation (SFA) software	F.	Supplier relationship management (SRM) software

Required:
Listed below are six descriptions of the software. On the blank line to the left of each number, insert the capital letter from the list above of the software that corresponds to the description. A letter should be used only once.

Answers		DESCRIPTIONS
_____	1.	Manages product data during a product's life.
_____	2.	Manages the interactions with the organizations that supply the goods and services to an enterprise.
_____	3.	Builds and maintains an organization's customer-related database.
_____	4.	Helps enable the steps in an organization's supply chain.
_____	5.	Allows a customer to inquire, perform a task (including make a purchase), or troubleshoot problems without the help of the organization's humans.
_____	6.	Automates sales tasks such as order processing, contact management, inventory monitoring, order tracking, and employee performance evaluation.

ANSWER:

Descriptions	Term or Concept
1.	E
2.	F
3.	A
4.	D
5.	B
6.	C

Chapter 02

162. Define enterprise resource planning (ERP) systems and give some examples of common ERP add-on modules.

ANSWER: Enterprise resource planning (ERP) systems are software packages that can be used for the core systems necessary to support enterprise systems. ERP products are designed to offer integration of virtually all of an organization's major business functions. Examples of common ERP add-on modules include customer relationship management (CRM) software; customer self-service (CSS) software; sales force automation (SFA) software; supply chain management (SCM) software; product life-cycle management (PLM) software; and supplier relationship management (SRM) software.

166. Discuss three ways that enterprise systems achieve quality of information goals.

ANSWER: The answer should include any three of the following.

Enterprise systems can collect a wide variety of data about business events and make that data available for use to all interested and authorized persons inside and outside the organization. The data should help all users (*relevance, understandability*) make decisions (*decision usefulness*) and analyze past events to make predictions about future events (*predictive/feedback value*).

An enterprise system's central database retains one version of data elements, uses that data to verify the accuracy of new data elements entered into the database, and applies business rules to permit only authorized changes to the database. Combined these improve the *reliability*, *validity*, and *accuracy* of the database.

Organization-wide enforcement of data standards and business rules means that business events will be handled *consistently* across the organization, that all relevant data will be collected (*completeness*), and that the collected data will be *verifiable* and *neutral*.

The integrated nature of the enterprise system makes all data available in a *timely* manner.

The system facilitates the sharing of services for *efficiency* and *consistency*.

167. List four pros and four cons of ERP packages.

ANSWER: The pros should include any four of the following:
One package across many functions
Best practices
Modular structure
No development needed (unless modifications are required)
Configurable
Reduced errors (business rules, enter data once)

The cons should include any four of the following:
Complex and inflexible
Best practices are shared by all who use it
Difficult to configure
Long implementation
Best of breed might be better than single ERP package
Can't meet all needs (developed for many user types)

168. Why might a firm decide to implement only certain modules in an ERP system rather than a complete implementation?

ANSWER: The answer should include such items as:
Cost considerations
Implementing additional modules one at a time or on an as needed basis with additional modules added at a later time
There may be legacy systems that they do not want to change
The firm may want to add on other modules from a combination of ERP vendors using enterprise application integration

170. Describe and explain these concepts and their relationship to one another: enterprise application integration, middleware, and application programming interface.

ANSWER: Enterprise application integration (EAI) is an approach to connecting together multiple pieces of an enterprise system and/or connecting the enterprise systems of different organizations. Middleware is a software product that connects two or more separate applications or software modules in this approach. An Application Programming Interface (API) is a type of middleware that is a means for connecting to a system or application provided by the developer of that application.
